## PREPARATORY PROBLEMS

# Preparatory Problems 

# 52 ${ }^{\text {nd }}$ IChO 2020 

International Chemistry Olympiad

Istanbul, Turkey

CHEMISTRY FOR A BETTER TOMORROW

First edition (31.01.2020)

## Preface

We are very glad to provide Preparatory Problems for the $52^{\text {nd }}$ International Chemistry Olympiad, which will be held in 2020 in Istanbul, Turkey. We prepared these problems with the intention of facilitating the training and preparation of participants. The contents of the problems have been carefully selected so as to cover a broad range of challenging topics that can be encountered in modern as well as classical chemistry. The problems can be solved by applying the fundamental principles of chemistry covered at high school level along with 6 topics of advanced difficulty for the theoretical section, and 3 topics of advanced difficulty for the practical section. These advanced topics are listed explicitly under "Topics of Advanced Difficulty" and their applications are demonstrated in the tasks. We expect the participants to be familiar with these advanced topics.

The problems listed in this booklet consist of 25 theoretical and 8 practical tasks. The solutions will be sent to the Head Mentor of each country by e-mail by March $1^{\text {st }}, 2020$ and will be published by May $15^{\text {th }}, 2020$ on our IChO 2020 website. We welcome any comments, suggestions, corrections, or questions about the problems at icho2020@tubitak.gov.tr.

The International Chemistry Olympiad presents a great opportunity to inspire younger generations to pursue a career in fundamental sciences and make a positive influence on public attitudes towards science, and in particular chemistry. We hope you will enjoy solving these problems and we look forward to seeing you in July in Istanbul, Turkey.

## Acknowledgments

I would like to express my deep gratitude to all the authors for their dedication and effort in contributing to the Preparatory Problems as well as the members of the International Steering Committee for their valuable comments and suggestions. We are also highly appreciative of the Scientific and Technological Research Council of Turkey (TUBITAK), in collaboration with the Faculty of Science, Istanbul Technical University (ITU), for facilitating all organizational tasks before and during IChO 2020.

On behalf of the Scientific Committee, Dr. Arif DAŞTAN

## Table of Contents

Authors ..... 4
Physical Constants and Equations ..... 5
Periodic Table of Elements ..... 7
${ }^{1}$ H NMR Chemical Shifts ..... 8
Typical Coupling Constants ..... 8
${ }^{13}$ C NMR Chemical Shifts ..... 9
IR Absorption Frequency Table ..... 9
Fields of Advanced Difficulty ..... 11
Part I: Theoretical Problems ..... 13
Problem 1. Salvia Species Growing in Turkey: Isolation and Total Synthesis of Abietane Diterpenoids ..... 14
Problem 2. Istanbulins and Related Sesquiterpene Natural Products ..... 19
Problem 3. Çay, Cha, Chai, Te, Tea, Tee, Thé, Thee, and Earl Grey Tea Flavor: Bergamot ..... 23
Problem 4. Early Russian Organic Chemists and Markovnikov’s Rule ..... 25
Problem 5. Arndt-Eistert Homologation ..... 29
Problem 6. Atovaquone ..... 32
Problem 7. Which is $( \pm)$-Trikentrin A? ..... 36
Problem 8. Stereoisomers of 1,2,3-Triphenylpropane-1,3-diol ..... 40
Problem 9. NMR, Symmetry, and Structural Analysis ..... 41
Problem 10. Woodward-Hoffmann Rules and Pericyclic Reactions ..... 44
Problem 11. Benzoporphyrin ..... 48
Problem 12. Blue to Green, Turquoise ..... 52
Problem 13. Spinel Oxides ..... 58
Problem 14. Platinum Complexes as Anticancer Drugs ..... 61
Problem 15. Sodium Compounds from Salt ..... 65
Problem 16. Thermal Springs of Turkey and Sulfur Chemistry ..... 68
Problem 17. Electrochemical Determination of Rutin ..... 72
Problem 18. Particle in a Box Problem: Free Electron Model ..... 76
Problem 19. Harmonic Oscillator and Rigid Rotor Models ..... 78
Problem 20. Journey to Different Earth-Like Planets ..... 80
Problem 21. Rate Constant Models and Kinetic Isotope Effect ..... 82
Problem 22. Parallel Reaction Kinetics ..... 85
Problem 23. Reaction Kinetics with Absorbance Measurement ..... 87
Problem 24. Acridine Orange / DNA Binding Interactions ..... 89
Problem 25. Spectrophotometric Determination of an Antihistaminic Drug ..... 93
Part II: Practical Problems ..... 95
Problem P1. Drug Delivery from a Polymeric Hydrogel System ..... 99
Problem P2. Determination of the Total Carbon Content of Oltu Stone (Black Amber) Samples ..... 104
Problem P3. Spectrophotometric Determination of the Equilibrium Constant for the Formation of a Complex ..... 108
Problem P4. 1-Bromobutane ..... 112
Problem P5. Cannizzaro Reaction ..... 116
Problem P6. 2,3-Dihydro-5,6-diphenylpyrazine ..... 123
Problem P7. Determination of Rate Constants for $n$-Butyl Acetate Hydrolysis ..... 126
Problem P8. Activation Energy of Bromide / Bromate Reaction ..... 129

## Physical Constants and Equations

Avogadro's constant, $N_{A}=6.0221 \times 10^{23} \mathrm{~mol}^{-1}$
Boltzmann constant, $k_{B}=1.3807 \times 10^{-23} \mathrm{JK}^{-1}$
Universal gas constant, $R=8.3145 \mathrm{JK}^{-1} \mathrm{~mol}^{-1}=0.08205 \mathrm{~atm} \mathrm{~L} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$
Speed of light, $c=2.9979 \times 10^{8} \mathrm{~ms}^{-1}$
Planck's constant, $h=6.6261 \times 10^{-34} \mathrm{~J} \mathrm{~s}$
Faraday constant, $F=9.6485 \times 10^{4} \mathrm{C} \mathrm{mol}^{-1}$
Mass of electron, $m_{e}=9.10938215 \times 10^{-31} \mathrm{~kg}$
Standard pressure, $P=1$ bar $=10^{5} \mathrm{~Pa}$
Atmospheric pressure, $P_{\text {atm }}=1.01325 \times 10^{5} \mathrm{~Pa}=760 \mathrm{mmHg}=760 \mathrm{torr}$
Zero of the Celsius scale, 273.15 K
1 picometer $(\mathrm{pm})=10^{-12} \mathrm{~m} ; 1 A^{0}=10^{-10} \mathrm{~m} ; 1$ nanometer $(\mathrm{nm})=10^{-9} \mathrm{~m}$
$1 \mathrm{eV}=1.6 \times 10^{-19} \mathrm{~J}$
$1 \mathrm{cal}=4.184 \mathrm{~J}$
$1 \mathrm{amu}=1.66053904 \times 10^{-27} \mathrm{~kg}$
Charge of an electron: $1.6 \times 10^{-19} \mathrm{C}$
Ideal gas equation: $\quad P V=n R T$
Enthalpy: $\quad H=U+P V$
Gibbs free energy: $\quad G=H-T S$

$$
\Delta G=\Delta G^{0}+R T \ln Q
$$

$$
\Delta G^{0}=-R T \ln K=-n F E_{\text {cell }}^{0}
$$

Entropy change:

$$
\Delta S=\frac{q_{r e v}}{T}, \text { where } q_{r e v} \text { is heat for the reversible process }
$$

$$
\Delta S=n R \ln \frac{V_{2}}{V_{1}} \text { (for isothermal expansion of an ideal gas) }
$$

Nernst equation: $\quad E=E^{0}+\frac{R T}{n F} \ln \frac{C_{o x}}{C_{\text {red }}}$
Energy of a photon: $\quad E=\frac{h c}{\lambda}$
Integrated rate law
Zero order: $\quad[A]=[A]_{0}-k t$
First order:

$$
\ln [A]=\ln [A]_{0}-k t
$$

Second order:

$$
\frac{1}{[A]}=\frac{1}{[A]_{0}}+k t
$$

Arrhenius equation: $\quad k=A e^{-E_{a} / R T}$
Equation of linear calibration curve: $y=m x+n$
$52^{\text {nd }}$ International Chemistry Olympiad, Istanbul, TURKEY

Standard deviation:

$$
s=\sqrt{\frac{\sum_{x=1}^{N}\left(x_{1}-\bar{x}\right)^{2}}{N-1}}
$$

Lambert-Beer equation: $A=\varepsilon l c$

## IR Absorption Frequency Table

| Functional Group | Type of Vibration | Absorption Frequency Region ( $\mathrm{cm}^{-1}$ ) | Intensity |
| :---: | :---: | :---: | :---: |
| Alcohol |  |  |  |
| O-H | (stretch, H-bonded) | 3600-3200 | strong, broad |
|  | (stretch, free) | 3700-3500 | strong, sharp |
| C-O | (stretch) | 1150-1050 | strong |
| Alkane |  |  |  |
| $\mathrm{C}-\mathrm{H}$ | stretch | 3000-2850 | strong |
|  | bending | 1480-1350 | variable |
| Alkene |  |  |  |
| $=\mathrm{C}-\mathrm{H}$ | stretch | 3100-3010 | medium |
|  | bending | 1000-675 | strong |
| $\mathrm{C}=\mathrm{C}$ | stretch | 1680-1620 | variable |
| Alkyl Halide |  |  |  |
| C-F | stretch | 1400-1000 | strong |
| $\mathrm{C}-\mathrm{Cl}$ | stretch | 800-600 | strong |
| $\mathrm{C}-\mathrm{Br}$ | stretch | 600-500 | strong |
| C-I | stretch | 500 | strong |
| Alkyne |  |  |  |
| C-H | stretch | 3300 | strong, sharp |
| $\mathrm{C} \equiv \mathrm{C}$ | stretch | 2260-2100 | variable, not present in symmetrical alkynes |
| Amine |  |  |  |
| $\mathrm{N}-\mathrm{H}$ | stretch | 3500-3300 | medium (primary amines have two bands; secondary have one band, often very weak) |
| $\mathrm{C}-\mathrm{N}$ | stretch | 1360-1080 | medium-weak |

| N-H | bending | 1600 | medium |
| :---: | :---: | :---: | :---: |
| Aromatic |  |  |  |
| C-H | stretch | 3100-3000 | medium |
| $\mathrm{C}=\mathrm{C}$ | stretch | 1600-1400 | medium-weak, multiple bands |
| Carbonyl |  |  |  |
| $\mathrm{C}=\mathrm{O}$ | stretch | 1820-1670 | strong |
| Acid |  |  |  |
| $\mathrm{C}=\mathrm{O}$ | stretch | 1725-1700 | strong |
| O-H | stretch | 3300-2500 | strong, very broad |
| C-O | stretch | 1320-1210 | strong |
| Aldehyde |  |  |  |
| $\mathrm{C}=\mathrm{O}$ | stretch | 1740-1720 | strong |
| C-H | stretch | 2850-2820 \& 2750-2720 | medium, two peaks |
| Amide |  |  |  |
| $\mathrm{C}=\mathrm{O}$ | stretch | 1690-1640 | strong |
| $\mathrm{N}-\mathrm{H}$ | stretch | 3500-3100 | unsubstituted have two bands |
|  | bending | 1640-1550 |  |
| Anhydride |  |  |  |
| $\mathrm{C}=\mathrm{O}$ | stretch | 1830-1800 \& 1775-1740 | two bands |
| Ester |  |  |  |
| $\mathrm{C}=\mathrm{O}$ | stretch | 1750-1735 | strong |
| C-O | stretch | 1300-1000 | two bands or more |
| Ketone |  |  |  |
| acyclic | stretch | 1725-1705 | strong |
| cyclic | stretch | 3-membered - 1850 | strong |
|  | stretch | 4-membered - 1780 | strong |
|  | stretch | 5-membered - 1745 | strong |
|  | stretch | 6-membered - 1715 | strong |
|  | stretch | 7-membered - 1705 | strong |
| $\begin{aligned} & \hline \alpha, \beta- \\ & \text { unsaturated } \end{aligned}$ | stretch | 1685-1665 | strong |
| conjugation moves absorptions to lower wavenumbers |  |  |  |
| aryl ketone | stretch | 1700-1680 | strong |
| Ether |  |  |  |
| C-O | stretch | 1300-1000 (1150-1070) | strong |
| Nitrile |  |  |  |
| $\mathrm{C} \equiv \mathrm{N}$ | Stretch | 2260-2210 | medium |
| Nitro |  |  |  |
| $\mathrm{N}-\mathrm{O}$ | stretch | $\begin{aligned} & 1560-1515 \& 1385- \\ & 1345 \end{aligned}$ | strong, two bands |

## Fields of Advanced Difficulty

## Theoretical

1. Pericyclic reactions (Cycloaddition and electrocyclization reactions).
2. Nucleophilic substitution reactions at $s p^{2}$ carbon centers.
3. Spectroscopy: Basic ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopy (chemical shifts, signal multiplicity, intensity and coupling constants); simple IR spectroscopy.
4. Kinetics: Rate constant models and kinetic isotope effect.
5. Basic quantum chemistry: Electronic energy levels, transitions applied to conjugated systems, vibrational and rotational motions of molecules (formulas provided), and simple theories of conjugated systems.
6. Inorganic chemistry: Coordination chemistry (crystal structure, crystal field theory, and isomerism) and molecular orbital energy diagrams of homo/heteronuclear diatomic molecules.

## Notes:

i) The following topics WILL NOT appear in the exam set:

- Metal-catalyzed cross-coupling reactions and olefin metathesis reactions.
- Use of Microsoft Excel or any related computer software.
- Use of derivatives and integrals.
- Although a few examples in the preparatory problems are related to biomolecules, students are not expected to cover any biochemistry or carbohydrate chemistry as advanced topics.
- Inorganic reaction mechanisms.
- Molecular orbital diagrams of polyatomic molecules.
ii) Unless important, the reaction conditions such as solvent and temperature have not been shown on the arrows in the reaction schemes.

## Practical

1. Use of a spectrophotometer (mono/double-wavelength measurements).
2. Basic techniques in organic synthesis: recrystallization, thin layer chromatography (TLC), filtration, and drying of precipitates following the described procedures.
3. Distillation and extraction.

## Notes:

During the practical exam, students WILL NOT be expected to:
$\Rightarrow$ Determine melting points.
$\Rightarrow$ Use a rotary evaporator.
$\Rightarrow$ Handle and work up moisture-sensitive compounds (using syringes and balloons).
$\Rightarrow$ Perform column chromatography.
$\Rightarrow$ Produce the hydrogel system by polymerization through the experiments.

## Part I: <br> Theoretical

 Problems
## Problem 1. Salvia Species Growing in Turkey: Isolation and Total Synthesis of Abietane Diterpenoids

The genus Salvia, named after a Latin word, salvare ("healer"), has a variety of species with important medicinal activities. They have been used for the treatment of colds, flu, and menstrual disorders in most regions of the world since ancient times. In Turkish folk medicine, Salvia L. species have also been used as a carminative, diuretic, hemostatic, spasmolitic, and stomachic, and in the treatment of mouth and throat irritations due to their antibacterial and wound healing properties. The genus Salvia includes over 900 species across the world, 58 of which are endemic in Turkey.

Female Turkish scientists Ulubelen \& Topçu with co-workers have studied Anatolian Salvia plants growing in Turkey, and isolated and characterized more than 320 natural products, most of which are terpenoids, while one third are new diterpenoids.

In one of their studies on Salvia multicaulis Vahl., Ulubelen \& Topçu isolated four new aromatic abietane norditerpenoids (1-4), which showed strong antituberculous activity. In addition to the antibacterial and antifungal activities of the isolated diterpenoids, the plant extracts also showed antioxidant, antiinflammatory, and cholinesterase inhibitory activities. S. multicaulis has folkloric use in Anatolia, such as an appetizer, for wound healing, against scorpion stings, and in the treatment of respiratory and urinary infections and diabetes.

1: R = H
$2: R=M e$

3: R = H
4 : R = Me

5

6

Later, a research group in Turkey developed a synthetic route to obtain derivatives of natural products $\mathbf{1 - 4}$. This problem covers the synthesis of related compounds. The following reaction schemes illustrate the total synthesis of diterpenoids $\mathbf{1}$ and $\mathbf{5}$.
1.1. Draw the structure of the products $\mathbf{A}-\mathbf{M}$, without any stereochemical detail. Hint: In second step $(\mathbf{A} \rightarrow \mathbf{B})$, combination of lithium bromide and cerium(IV) ammonium nitrate (CAN) is used as a brominating reagent. Compound $\mathbf{C}$ is a benzaldehyde derivative and used in the synthesis step of compound $\mathbf{M}$.
1.2. During the cyclization of $\mathbf{H}$ to $\mathbf{I}-\mathbf{1}$, another isomeric compound, $\mathbf{I}-\mathbf{2}$, with the formula $\mathrm{C}_{18} \mathrm{H}_{20} \mathrm{O}$, is also formed. Draw the structure of I-2.

$\xrightarrow[19]{\mathbf{H}} \xrightarrow[\text { 2) } \mathrm{CO}_{5} \mathrm{H}_{11} \mathrm{ONO}, \mathrm{H}^{+}]{\text {1) } \mathrm{H}_{2}, \mathrm{Pd}} \quad \begin{gathered}\mathrm{I-1} \\ \mathrm{C}_{18} \mathrm{H}_{20} \mathrm{O}\end{gathered}$

$$

1.3. The following reaction scheme is related to the synthesis of $\mathbf{6}$, a desmethyl derivative of the diterpenoids $\mathbf{1}$ and 2. Draw the structures of products $\mathbf{N}-\mathbf{Y}$, without any stereochemical detail. Hint: Compounds $\mathbf{R}, \mathbf{S}$ and $\mathbf{T}$ exhibit acidic character. The transformation of compound $\mathbf{V}$ to $\mathbf{W}$ includes Robinson annulation and a possible deformylation reaction steps.

1.4. During the transformation of compound $\mathbf{V}$ to $\mathbf{W}$ (Robinson annulation step), the use of a precursor of the $\alpha, \beta$-unsaturated ketone, such as a $\beta$-chloroketone or $N, N, N$,-trialkyl-3-oxobutan-1-aminium halide (as used in the reaction scheme), can be more favorable. Explain.
1.5. Draw possible tautomeric forms of compound $\mathbf{V}$.
1.6. Compound $\mathbf{Y}$ can be also obtained via ring-closing (electrocyclization) of the compound $\mathbf{Z}$. Draw structure of $\mathbf{Z}$.
1.7. For the transformation of $\mathbf{X}$ to $\mathbf{Y}$, which of the following reagents can also be used? (Ignore $\mathrm{S}_{\mathrm{N}} 2^{\prime}$ type reactions).i) $\mathrm{PBr}_{3} /$ pyridine; ii) $n$ - $\mathrm{Bu}_{3} \mathrm{SnH} / \mathrm{AIBN}$
i) $\mathrm{PBr}_{3} /$ pyridine; ii) $\mathrm{Na} / t-\mathrm{BuOH}$i) $\mathrm{MnO}_{2}$; ii) DDQ

## Problem 2. Istanbulins and Related Sesquiterpene Natural Products

Some elements received their names from different places around the world. In this respect, the record belongs to the Swedish village of Ytterby, after which four elements were named: ytterbium (Yb), yttrium (Y), erbium (Er), and terbium (Tb). However, elements are not the only chemical entities that owe their names to such places. Interestingly, a class of natural products, istanbulins $\mathbf{A}-\mathbf{E}$, received their names from the city of Istanbul. The first two members of this family, istanbulins A and B, were first isolated by Prof. Dr. Ayhan Ulubelen and co-workers from the plant Smyrnium olusatrum in 1971. The isolation of the remaining members, istanbulins C-E, was reported by Ulubelen and co-workers between 1979 and 1982.

Istanbulin A

Istanbulin B

Istanbulin C

Istanbulin D

Istanbulin E

Istanbulins constitute a subclass of a much larger family of natural products called sesquiterpenes. Two important sesquiterpene natural products with a similar 6-6-5 fused ring system are vernolepin (1) and vernomenin (2). Danishefsky and co-workers reported an elegant total synthesis of these two natural products in 1976 via the utilization of the Diels-Alder (DA) chemistry of the so-called Danishefsky's diene.

Please note that all formulae depicting chiral molecules in this question refer to racemic mixtures.

Vernolepin
1

Vernomenin
2

In this context, Danishefsky's diene (3) and the Rawal-Kozmin diene (4) are two electron-rich dienes that found widespread use in organic synthesis, and their structures are shown below.

Danishefsky's diene
3

Rawal-Kozmin diene
4

TMS: trimethylsilyl; TBS: tert-butyldimethylsilyl
2.1. Draw the major resonance structures of dienes $\mathbf{3}$ and $\mathbf{4}$. Indicate the carbon atoms with higher electron density on each diene.
2.2. Compounds 3 and $\mathbf{4}$ have been extensively used as diene components in Diels-Alder reactions. Draw the conformations of $\mathbf{3}$ and $\mathbf{4}$ required to be able to enter a DA reaction. Predict which compound is a more reactive diene in a DA reaction with maleic anhydride (5).

5
2.3. When a mixture of Danishefsky's diene (3) and compound 6 was heated followed by treatment with acid (TsOH, p-toluenesulfonic acid), compound $\mathbf{A}$ was obtained as the major product.

Draw the structures of all possible Diels-Alder products with the molecular formula of $\mathrm{C}_{12} \mathrm{H}_{14} \mathrm{O}_{3}$ that can be obtained from the reaction of $\mathbf{3}$ and $\mathbf{6}$. Drawing only one enantiomer of an enantiomeric pair is sufficient.

2.4. Determine the structure of the major product $\mathbf{A}$.
2.5. Diels-Alder adduct $\mathbf{A}$ was converted to compound 7 via a sequence of 4 steps as shown below. Compound $\mathbf{B}$ is known to be acidic. Draw the structures of $\mathbf{B}-\mathbf{D}$.

2.6. When compound 7 is reacted with 1 equiv of $m$-CPBA, product $\mathbf{E}$ was obtained as a major product. Circle the functional group that reacts selectively with $m$-CPBA, and draw the structure of $\mathbf{E}$.

2.7. The syntheses of vernolepin (1) and vernomenin (2) were completed as shown in the scheme below. Draw the structures of compounds $\mathbf{F}-\mathbf{J}$. In the final step, compound $\mathbf{I}$ is the precursor of $\mathbf{1}$.

## Problem 3. Çay, Cha, Chai, Te, Tea, Tee, Thé, Thee, and Earl Grey Tea Flavor: Bergamot

| Cha | Chinese, Japanese, Korean, Portuguese..... |  |
| :---: | :---: | :---: |
| Chai | Russian, Persian... |  |
| Çay | Turkish, Azerbaijani... |  |
| čaj | Bosnian, Croatian, Czech, Serbian, Slovak.. |  |
| Shay | Arabic... |  |
| Te | Italian, Spanish... |  |
| Tea | English... |  |
| Tee | German... |  |
| Thé | French... |  |
| Thee | Dutch... |  |
| Chaay | Hindi... |  |
| ..... | $\ldots$ |  |

Tea (in Turkish: çay) is popular throughout Turkey and the Turkish diaspora. Turkish tea culture also extends from Azerbaijan to some countries in the Balkan Peninsula. Turkey has the highest per capita tea consumption in the world, i.e. $2.5 \mathrm{~kg} /$ person per year, followed by the United Kingdom ( $2.1 \mathrm{~kg} /$ person per year).

Bergamotene and derivatives (1-4), sesquiterpenes, are analogues of pinnae monoterpenes.

Found in bergamot oil, the bergamotenes contribute to the aroma and flavor of Earl Grey tea.

1
$\alpha$-trans-bergamotene

2

3

4
$\beta$-cis-bergamotene
3.1. The following reaction scheme illustrates the synthesis of $\alpha$-trans-bergamotene (1). $\underline{\text { Draw }}$ the structures of products $\mathbf{A}-\mathbf{G}$.
3.2. What is the function of $\mathrm{Me}_{3} \mathrm{NO}$ reagent in the transformation of $\mathbf{A}$ to $\mathbf{B}$ ?

## Problem 4. Early Russian Organic Chemists and Markovnikov's Rule

The last year was devoted to the $150^{\text {th }}$ anniversary of the discovery of Markovnikov's rule, formulated by Vladimir V. Markovnikov in 1869. Markovnikov was a PhD student of the famous early Russian scientist Alexander Butlerov. In his PhD thesis in 1869, Markovnikov discovered the famous rule that exists in almost every textbook on organic chemistry. According to Markovnikov's rule, when an unsymmetrical alkene or alkyne reacts with a hydrogen halide (hydrogen chloride, hydrogen bromide, or hydrogen iodide), the hydrogen atom of HX adds to the carbon atom having the highest number of hydrogen atoms. However, depending on the reagent or substrate, in some cases, opposite results could also be possible, and these kinds of reactions are called anti-Markovnikov addition. Although Markovnikov's rule was developed for and is specifically applied to the addition of hydrogen halides to alkenes or alkynes, many other additions are also described as Markovnikov or anti-Markovnikov depending on the regioselectivity of the addition reaction.

Actually, the rule should be revised as follows: "addition to this kind of double or triple bond proceeds through more stable intermediates". In some cases, besides electronic effects, steric effects can also affect the formation of Markovnikov or anti-Markovnikov addition products.

The following problems are mainly related to discoveries described by the student of the more distinguished organic chemist Alexander Butlerov or his colleagues at Kazan University, Tatarstan, Russia.
4.1. Draw the structures of major products A-E, including the appropriate stereochemistry (ignore optical isomerism).

4.2. Draw the structures of major products $\mathbf{F}$ and $\mathbf{G}$ for the following reactions.

## Wagner-Meerwein Rearrangement (WMR)

Wagner is another famous scientist who worked at Kazan University contemporaneously with Butlerov and Markovnikov. Wagner proposed that bornyl chloride undergoes an internal rearrangement to form pinene. Meerwein then generalized this type of rearrangement. Thus, this kind of reaction was named Wagner-Meerwein rearrangement. These reactions take place when a carbocation is formed. Generally, a carbocation is rearranged to a more stable
carbocation, if possible, by neighboring group migration. In addition, if the reaction does not proceed through a carbocation or borderline carbocation intermediates, rearrangements do not take place.
4.3. Considering the formation of intermediates for every reaction, draw the structures of reagents $\mathbf{H}$ and $\mathbf{I}$ and major products $\mathbf{J}-\mathbf{M}$.

## Acid-catalyzed Wagner-Meerwein Rearrangement

The acid-catalyzed reaction of 4,4-dimethylcyclohexa-2,5-dien-1-one resulted in the formation of a compound, the NMR data of which are given below.

For $\mathbf{N} ;{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=6.95(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.61(\mathrm{~d}, J=2.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.57$ (dd, $J=8.0,2.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.39(\mathrm{bs}, 1 \mathrm{H}), 2.16(\mathrm{~s}, 3 \mathrm{H}), 2.14(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 153.4,137.9,130.4,128.6,116.6,112.3,19.8,18.7$.
4.4. Find the structure of product $\mathbf{N}$ and propose a plausible mechanism.
4.5. What kind of difference do you expect in the ${ }^{1} \mathrm{H}$ NMR spectrum after a drop of $\mathrm{D}_{2} \mathrm{O}$ is added to the solution in the NMR tube?

## Zaitsev’s Rule

Zaitsev, who described a rule named after him (Zaitsev's or Saytzeff's or Saytzev's rule), was another PhD student of Butlerov's. Zaitsev's rule is an empirical rule for estimating preferred alkene product(s) in elimination reactions. At Kazan University, the chemist Alexander Zaitsev studied various elimination reactions and observed a general trend in the resulting alkenes. More generally, Zaitsev's rule stipulates that in an elimination reaction the most substituted product will be formed. The following problem is mainly related to Zaitsev's rule.
4.6. Draw the structures of elimination products $\mathbf{O}-\mathbf{Q}$ and compound $\mathbf{R}$. What is the major product formed by the thermal reaction of $\mathbf{R}$ described in the following scheme?

1) $\mathrm{NHMe}_{2}$
2) Mel
3) $\mathrm{Ag}_{2} \mathrm{O}, \mathrm{H}_{2} \mathrm{O}$

4.7. Which base(s) can be used to increase the ratio of $\mathbf{Q}$ relative to EtONa?NaOMeKOMe$i$-PrOK$t$-BuOK$\mathrm{NH}_{3}$DBU$i-\mathrm{Pr}_{2} \mathrm{NEt}$

## Problem 5. Arndt-Eistert Homologation

Fritz Georg Arndt (6 July 1885-8 December 1969) was a German chemist who had a great influence on the development of chemistry in Turkey. He was employed for two decades of his professional life at Istanbul University in two distinct periods. He discovered the Arndt-Eistert synthesis with Bernd Eistert. The Arndt-Eistert synthesis is the chemical reaction for onecarbon homologation (i.e. the conversion of $\mathrm{RCO}_{2} \mathrm{H}$ to $\mathrm{RCH}_{2} \mathrm{CO}_{2} \mathrm{H}$ ) of carboxylic acids and is called the homologation process. In the Arndt-Eistert homologation, the key step is the Wolff rearrangement of diazoketones to ketenes, which can be achieved thermally, photochemically, or by silver (I) catalysis. The reaction is conducted in the presence of nucleophiles such as water, alcohols, or amines to capture the ketene intermediate to yield carboxylic acids, esters, or amides, respectively. In this problem, synthesis of indolizidine alkaloids is studied.

5.1. As depicted in the scheme below, the synthesis of indolizidines 167B and coniceine could be easily and concisely achieved from $\beta, \gamma$-unsaturated ester $\mathbf{B}$. The key step $(\mathbf{A} \rightarrow \mathbf{B})$ is the Wolff rearrangement. Compound $\mathbf{C}$ has a lactam core, which is a bicyclic heterocycle containing a six-membered ring fused to a saturated five-membered ring, one of the bridging atoms being nitrogen.

Draw the structures of $\mathbf{A}-\mathbf{D}$ without any stereochemical detail.

5.2. In the Arndt-Eistert homologation reaction, an $\alpha$-diazo ketone can undergo photochemical Wolff rearrangement to form $\alpha$-ketocarbene via nitrogen extrusion. This intermediate undergoes a 1,2-alkyl shift to give the ketene product.
$\underline{\text { Draw }}$ the structures of the $\alpha$-ketocarbene and ketene intermediates in the second step $(\mathbf{A} \rightarrow \mathbf{B})$.
5.3. Addition of propylmagnesium bromide to compound $\mathbf{C}$, followed by $\mathrm{AcOH} / \mathrm{NaBH}_{4}$, is the last step in the total synthesis of indolizidine 167B.

Draw the structure of an intermediate $\left(\mathbf{C}_{\mathbf{1 1}} \mathbf{H}_{\mathbf{2 0}} \mathbf{N}^{+}\right)$in the fourth step $(\mathbf{C} \rightarrow \mathbf{D})$.
5.4. An alternative synthesis of coniceine is depicted below. Draw the structures of $\mathbf{E}-\mathbf{J}$.

## Problem 6. Atovaquone

Atovaquone, an approved drug, is used to treat pneumocystosis and malaria. Ketoester $\mathbf{1}$ and aldehyde $\mathbf{2}$ are key compounds in the synthetic process of atovaquone.

6.1. The synthesis of key compound ketoester 1 is shown below. A mixture of phthalic anhydride and $\mathrm{Et}_{3} \mathrm{~N}$ is treated with diacid. Gas evolution is observed during this period. Treatment of the reaction mixture with $a q . \mathrm{HCl}$ solution provides formation of acid $\mathbf{3}$ through intermediate $\mathbf{A}$ with two carboxylic acid groups. Acid $\mathbf{3}$ is converted to the isomeric intermediate $\mathbf{B}$, containing both hemiacetal and ester functionalities, followed by dehydration to the alkene $\mathbf{C}$, which is then brominated to give $\mathbf{D}$ under acidic condition. Dibromide $\mathbf{D}$ undergoes solvolysis in a hot mixture of $\mathrm{H}_{2} \mathrm{O} / \mathrm{AcOH}$ to give tertiary carbocation intermediate $\mathbf{E}$, which is then trapped with water to give intermediate hemiacetal $\mathbf{F}$. Finally, rearrangement of intermediate hemiacetal $\mathbf{F}$ provides key compound 1.

Note: The square brackets denote that the product was not isolated but reacted further without purification. The conversion of $\mathbf{3}$ to $\mathbf{1}$ is a one-pot reaction that involves a series of reactions occurring one after another in the same vessel without isolation and purification of intermediates.

Spectroscopic data for intermediates B and C: B: ${ }^{1} \mathrm{H}$ NMR $\delta=7.86-7.52(4 \mathrm{H}), 4.13(\mathrm{bs}, 1 \mathrm{H}$, exchangeable with $\mathrm{D}_{2} \mathrm{O}$ ), $1.97(\mathrm{~s}, 3 \mathrm{H}) . \mathbf{C}:{ }^{1} \mathrm{H}$ NMR $\delta=7.92-7.58(4 \mathrm{H}), 5.24(\mathrm{~m}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\delta=166.8,151.8,139.0,134.4,130.4,125.3,125.1,120.6,91.3 ; \mathrm{MS} \mathrm{m} / \mathrm{z}=146.0$

Draw the structure of intermediates $\mathbf{A}-\mathbf{F}$ in the synthesis of $\mathbf{1}$.
6.2. The synthesis of aldehyde 2 starts from cyclohexene by key steps including Friedel-Crafts acylations, haloform, reduction, and oxidation. Friedel-Crafts acylation of cyclohexene with acetyl chloride yields chlorocyclohexyl methyl ketone $\mathbf{J}$. Reaction of cyclohexene with acetyl chloride produces an initial carbocation $\mathbf{G}$ that undergoes two successive Wagner-Meerwein hydride migrations to form isomeric carbocations $\mathbf{H}$ and $\mathbf{I}$, respectively. Trapping of carbocation $\mathbf{I}$ with chloride ion produces $\mathbf{J}$, the Friedel-Crafts reaction of which with chlorobenzene provides $\mathbf{K}$. Haloform reaction of methyl ketone $\mathbf{K}$ using sodium hypochlorite $(\mathrm{NaOCl})$ gives the corresponding acid $\mathbf{L}$. Acid $\mathbf{L}$ is converted into the aldehyde $\mathbf{2}$ in a several-step reaction sequence.

Draw structure of isomeric carbocations $\mathbf{G}-\mathbf{I}$ formed in this reaction.

6.3. Are these carbocations chiral?

6.4. Draw the structure of $\mathbf{J}-\mathbf{L}$.
6.5. Choose all correct statements for $\mathbf{L}$.$\mathbf{L}$ has 4 stereoisomers.$\mathbf{L}$ is a chiral compound.$\mathbf{L}$ is an achiral compound.$\mathbf{L}$ is a meso compound.$\mathbf{L}$ has 2 stereoisomers.Stereoisomers of $\mathbf{L}$ are diastereomers of each other.Stereoisomers of $\mathbf{L}$ are enantiomers of each other.
6.6. Which of the following compound(s) result(s) in the haloform reaction of $\mathbf{K}$ ?$\mathrm{CH}_{2} \mathrm{Cl}_{2}$$\mathrm{CH}_{3} \mathrm{Cl}$$\mathrm{CHCl}_{3}$$\mathrm{CCl}_{4}$
6.7. Which of the following reagents are appropriate to form aldehyde $\mathbf{2}$ from $\mathbf{L}$ ?

Choose all correct reactions.L $\xrightarrow[\text { 2) }(\mathrm{COCl})_{2}, \mathrm{DMSO}_{3}, \mathrm{NEt}_{3}]{\text { 1) a) } \mathrm{LiAlH}_{4} \text { b) } \mathrm{H}_{3} \mathrm{O}^{+}} \mathbf{2}$1) $\mathrm{CH}_{3} \mathrm{OH} / \mathrm{H}^{+}$ 2) a) DIBAL-H (1 equiv), $-78^{\circ} \mathrm{C}$ b) $\mathrm{H}_{3} \mathrm{O}^{+}$L

## Problem 7. Which is ( $\pm$ )-Trikentrin A?

Although the indole skeleton is ubiquitous in nature, annulated indoles at any of the benzenoid positions are uncommon. The trikentrins and the structurally similar herbindoles represent fascinating such examples of 6,7-annulated indole or polyalkylated cyclopent $[g]$ indole natural products. The trikentrins were isolated from the marine sponge Trikentrion flabelliforme and possess antibacterial activity. Possible structures for trikentrin A are shown in the Figure below. In this problem, we will find out which of these structures is trikentrin A.

11

4

8

12

There are several ways to synthesize trikentrin A. Two routes below involve aryne-based and hydrovinylation strategies and both finally lead to the formation of trikentrin A. The first step for problems 8.1 and 8.2 is the Bartoli reaction or Bartoli indole synthesis, which is the organic reaction of ortho-substituted nitroarenes with vinyl Grignard reagents to yield substituted indoles. In particular, it is the most efficient route to 7 -substituted indoles.

$( \pm)-$ Trikentrin A: ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 8.08(\mathrm{bs}, \mathrm{NH}, 1 \mathrm{H}), 7.15-6.59(3 \mathrm{H}), 3.44(\mathrm{dt}, J=8.8$,

8.1. Draw all possible stereoisomers of 1,2,3-triphenylpropane-1,3-diol.
8.2. List all the achiral compounds.
8.3. List all the chiral compounds.
8.4. Which of the following properties or methods can be used to distinguish between the chiral compounds from question 8.3? Choose all correct statements.boiling pointUV spectroscopyrefractive indexmelting pointoptical rotationdipole momentNMR spectroscopy in an achiral environmentIR spectroscopy

## Problem 9. NMR, Symmetry, and Structural Analysis

## Naphthalene halides: Key compounds for many applications

Besides benzene, naphthalene is one of the best-known aromatic hydrocarbons. Therefore, the chemistry of naphthalene (1) has been extensively studied and many naphthalene derivatives have been synthesized. Halogen derivatives of this kind of compound are key for many transformations. For this reason, nearly all halogenated derivatives of naphthalene are known in the literature. Both ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of symmetric compounds are characteristic, and allow researchers to exclude possible non-symmetrical structures to analyze the correct structures. Let us consider naphthalene tetrabromide isomers 2.

1
Naphthalene

2
Naphthalene tetrabromides
9.1. Draw the structures of all naphthalene tetrabromide(s) with 3 signals in ${ }^{13} \mathrm{C}$ NMR and one signal (singlet) in ${ }^{1} \mathrm{H}$ NMR spectra.
9.2. Draw the structures of all naphthalene tetrabromide(s) with 5 signals in ${ }^{13} \mathrm{C}$ NMR spectra.
9.3. Draw the structures of all naphthalene tetrabromide(s) with 6 signals in ${ }^{13} \mathrm{C}$ NMR and a doublet $(J=8-9 \mathrm{~Hz})$ in ${ }^{1} \mathrm{H}$ NMR spectra.
9.4. Draw the structures of all naphthalene tetrabromide(s) with 6 signals in ${ }^{13} \mathrm{C}$ NMR and a doublet ( $J=1.5-2.0 \mathrm{~Hz}$ ) in ${ }^{1} \mathrm{H}$ NMR spectra.

## Dynamic NMR: fast transformation between tautomeric forms and identical nuclei in NMR

Bullvalene (3) is very suitable for degenerate Cope rearrangements. Without counting enantiomers, the number of possible valence tautomers of a bullvalene with ten distinguishable positions is $10!/ 3=1,209,600$. This arrangement enables all carbon and hydrogen atoms to appear equivalent on the NMR timescale. At sufficiently high temperature, both ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra of bullvalene show only one signal, average to a rounded peak. However, at $-60^{\circ} \mathrm{C}$, as Cope rearrangements do not take place, olefinic and aliphatic protons are observed separately.

9.5. At low temperature, ignoring any Cope rearrangement, how many carbon signals do you expect from the ${ }^{13} \mathrm{C}$ NMR spectrum of bullvalene?

Label identical carbon atoms with letters $\mathbf{a}, \mathbf{b}, \mathbf{c} \ldots$ on the molecular structure.
9.6 Owing to fast tautomerism, some molecules give clearer spectra due to apparent symmetry. In light of this information, how many signals do you expect from the ${ }^{13} \mathrm{C}$ NMR spectra of the following compounds?

1H-imidazole 1-methyl-1H-imidazole

$\beta$-tropolone

$\chi$-tropolone

2-methoxtropone
9.7. In the literature, it has been shown that the tropolone diacetate derivative $\mathbf{4}$ has fewer signals than expected in ${ }^{13} \mathrm{C}$ NMR spectroscopy.

Draw reasonable resonance structure(s) and/or transformation(s) responsible for this symmetry. How many signals do you expect for this molecule in the ${ }^{13} \mathrm{C}$ NMR spectrum?

## Stereochemistry of the epoxidation reaction of bicyclic alkenes.

9.8. Considering the following pieces of information, draw the structures of all possible stereoisomers formed under the given reaction conditions.

Hint: $\mathbf{A}$ and $\mathbf{B}$ are isomers with 3 signals and $\mathbf{C}$ is an isomer with 4 signals in ${ }^{13} \mathbf{C}$ NMR spectroscopy.

9.9. Draw the structures of the stereoisomer(s) formed under the given reaction conditions. How many signals do you expect for the epoxide product(s) in ${ }^{13} \mathrm{C}$ NMR spectra?

## Problem 10. Woodward-Hoffmann Rules and Pericyclic Reactions

The Woodward-Hoffmann rules (or the pericyclic selection rules), developed by Robert B. Woodward and Roald Hoffmann, are used to rationalize or predict some stereochemical aspects and the activation energy of pericyclic reactions. They are for all classes of pericyclic reactions (and their reverse 'retro' processes), such as cycloadditions, sigmatropic shift, electrocyclization, ene, and cheletropic reactions.

| Woodward-Hoffmann rules for electrocyclic reactions |  |  |
| :--- | :--- | :--- |
| System | Conditions | Motion |
| $4 n$ | thermal $(\Delta)$ | conrotatory (con) |
|  | photochemical (hv) | disrotatory (dis) |
| $4 n+2$ | thermal | disrotatory |
|  | photochemical | conrotatory |

10.1. Thermal reaction of compound 1 results in the formation of endiandric acid $\mathbf{2}$ by a series of pericyclic reactions. Show all steps and classify their pericyclic processes.

How many $\pi$ electrons are involved in the following reactions? Are these reactions thermally or photochemically allowed according to the Woodward-Hoffmann rules?
10.2.

10.3.

10.4. Domino Diels-Alder reaction of $\mathbf{A}$ with succinimide results in the formation of adduct $\mathbf{3}$. Draw the structures of $\mathbf{A}-\mathbf{C}$.

10.5. The following reaction scheme illustrates the synthesis of endo-isomer of benzenoid tetracyclic hydrocarbon I starting from $o$-xylene. $\mathrm{Br}_{2}$-elimination of tetrabromo-o-xylene $\mathbf{D}$
with sodium iodide leads to a reactive intermediate which undergoes a $4 \pi$ electrocyclization to yield compound $\mathbf{F}$. Draw the structures of intermediates and products $\mathbf{D}-\mathbf{I}$.

## retro-Diels-Alder Reaction

The retro-Diels-Alder ( $r \mathrm{DA}$ ) reaction is the reverse of the Diels-Alder reaction, i.e., the formation of diene and dienophile from cyclohexene. Generally, an $r \mathrm{DA}$ reaction is initiated by heating. In some cases, low temperature is sufficient for this transformation, depending on the nature of the substrate.
10.6. Cyclopentadienes are very useful synthetic intermediates in the fields of organic and coordination chemistry. Parent (unsubstituted) cyclopentadiene is obtained by the thermal decomposition of dicyclopentadiene. However, substituted cyclopentadienes are generally unstable due to the facile migration of the endocyclic double bonds. Consequently, practical and general methods for the synthesis of substituted cyclopentadienes are limited. In the following reaction scheme, the synthesis of a substituted cyclopentadiene derivative is given. Besides rDA, some steps also involve the inverse-Diels-Alder reaction, which is a cycloaddition between an electron-rich dienophile and an electron-poor diene (such as tetrazine 4), through the interaction of the HOMO orbital of dienophile and the LUMO orbital of diene.

Draw the structures of the intermediates and products $\mathbf{J}-\mathbf{N}$.

10.7. Nucleophilic aromatic substitution reactions constitute an important class of reactions in synthetic organic chemistry. In the following scheme, the reactions of aryl halide $\mathbf{5}$ proceed via two different kinds of intermediates in presence of a cyclic 1,3-diene depending on the reaction conditions and the nature of the substituent on the aromatic ring. Draw the structures of products $(\mathbf{O}$ and $\mathbf{P})$, and discuss possible intermediates responsible for the formation of these products.

## Problem 11. Benzoporphyrin

The name "porphyrin" derives from the Greek word porphyra, meaning purple. Porphyrins are a group of macrocycle organic compounds, composed of four modified pyrrole subunits. They have a total of $26 \pi$-electrons, 18 of which form a planar porphyrin ring structure. They are often described as aromatic. Metal complexes derived from porphyrins occur naturally. One of the best-known families of porphyrin complexes is heme, the pigment in red blood cells. A benzoporphyrin is a porphyrin with a benzene ring fused to pyrrole unit(s).
11.1. Benzoporphyrins can be prepared starting from a masked pyrrole derivative E. The synthesis of $\mathbf{E}$ starts with a reaction of cis-1,2-dichloroethene and thiophenol to give $\mathbf{A}$. Oxidation of $\mathbf{A}$ yields $\mathbf{B}$ having phenylsulfonyl units. The cis-product $\mathbf{B}$ is then converted to its trans isomer $\mathbf{C}$ when treated with a catalytic amount of $\mathrm{Br}_{2}$ under UV light. The Diels-Alder reaction between $\mathbf{C}$ and 1,3-cyclohexadiene under thermal conditions gives the product $\mathbf{D}$, which is converted to a pyrrole carboxylic acid ester when reacted with ethyl isocyanoacetate. Ester then is treated with TFA to give the pyrrole derivative $\mathbf{E}$.

Draw the structures of compounds $\mathbf{A}-\mathbf{E}$ including stereochemistry when necessary.

11.2. Porphyrins can easily be prepared via a cyclization reaction of pyrrole derivatives with aldehydes. Draw the structure of aldehyde $\mathbf{F}$ and determine the oxidation state of zinc in compound $\mathbf{H}$.

11.3. When $\mathbf{H}$ is heated under vacuum, it can give a more conjugated product through a retro-Diels-Alder reaction.

To complete the structure of $\mathbf{I}$, $\underline{\text { draw }}$ the structures of the dashed circle part of $\mathbf{I}$ (all the circles are identical) and $\mathbf{J}$.

Ammonia is a major metabolic compound and the importance of its sensitive detection has been emphasized recently because of its correlation with specific diseases. In normal physiological conditions, ammonia can be expelled from slightly alkaline blood and emanated through the skin or exhaled with the breath. Dysfunction in the kidney or liver that converts ammonia to urea can result in an increase in the ammonia concentration in breath or urine. Consequently, the detection of the ammonia present in breath or urine can be used for the early diagnostics of liver or stomach diseases. The development of sensor devices for measuring ammonia with a sensitivity of $50 \mathrm{ppb}-2 \mathrm{ppm}$ and with a fast response time is highly desired.

For that purpose, I was used to prepare a fiber-optic ammonia gas sensor. Exposure of this sensor to ammonia changes the transmittance of the fiber-optic. By using an appropriate spectrometer, ammonia gas in different concentrations was passed through the sensor and the change in transmittance was measured. The results of these measurements are listed in the Table below.

| $\left[\mathbf{N H}_{3}\right]$ (ppm) | Sensor response <br> $(\%)$ |
| :--- | :--- |
| 0.500 | -0.2540 |
| 1.00 | -0.7590 |
| 2.00 | -1.354 |
| 4.00 | -1.838 |
| 7.00 | -2.255 |
| 9.00 | -2.500 |
| 11.0 | -2.600 |
| 20.0 | -2.947 |
| 25.0 | -3.152 |
| 30.0 | -3.256 |

11.4. Using the linear region of sensor response data prepare a calibration curve and find the calibration equation as $y=a+b x$.
11.5. This sensor is then used for the detection of ammonia in human breath. When a kidney patient's breath was fed into the sensor, a $-3.812 \%$ change in the response is observed. Calculate the ammonia concentration in the patient's breath.

## Problem 12. Blue to Green, Turquoise

The beauty of the turquoise color of Lake Salda, where blue meets white sands, fascinates those who see it. Lake Salda, in the southern province of Burdur's Yeşilova district, has been referred to as "Turkey's Maldives" in recent years for its white sandy beaches and turquoise water. In fact, turquoise is an opaque, blue to green mineral that is a hydrated phosphate of copper and aluminum with the chemical formula of $\mathrm{CuAl}_{6}\left(\mathrm{PO}_{4}\right)_{4}(\mathrm{OH})_{8} \cdot 4 \mathrm{H}_{2} \mathrm{O}$, and is known as a gemstone. The word turquoise dates back to the $17^{\text {th }}$ century and is derived from the French turquois, meaning "Turkish" because the mineral was first brought to Europe through Turkey, from mines in the historical Khorasan Province of Persia. Phosphorus, which is also in the structure of turquoise, is an essential part of life. Without the phosphates in biological molecules such as ATP, ADP, and DNA, we would not survive. Phosphorus compounds can be found in the minerals in our bones and teeth. With few exceptions, minerals containing phosphorus are in the maximally oxidized state as inorganic phosphate rocks, which are partially made of apatite, and they are today the chief commercial source of this element. Phosphate products are used as fertilizers in agriculture. They are also used in animal feeds, as a leavening agent in baking powder and flour, as an additive to beverages, and in pharmaceuticals. Industrial uses include water softening, rust proofing, fire proofing, in insecticides and detergents, and for the manufacture of elemental phosphorus.

Lake Salda

There are three important allotropes of phosphorus: $\mathbf{X}, \mathbf{Y}$, and $\mathbf{Z}$. However, another form of phosphorus, $\mathbf{W}$, also exists (given below). $\mathbf{X}$ is a soft, waxy solid. It is exceptionally harmful
and to a great degree reactive and also displays chemiluminescence. Crystals of $\mathbf{X}$ are composed of $\mathrm{P}_{4}$ molecules. $\mathbf{Y}$ is obtained by heating $\mathbf{X}$ to $250{ }^{\circ} \mathrm{C}$ within the sight of daylight. It is nonpoisonous and odorless. $\mathbf{Y}$ does not show chemiluminescence. It exists as a polymeric solid. $\mathbf{Z}$ is produced from $\mathbf{X}$ under inert atmosphere. $\mathbf{Z}$ is the most stable allotrope of phosphorus and has a layered structure. $\mathbf{W}$ is a form of phosphorus that can be produced by day-long annealing of $\mathbf{Y}$ above $550^{\circ} \mathrm{C}$.

The interconvertible forms of all allotropes of phosphorus
12.1. Identify allotropes of phosphorus indicated by $\mathbf{X}, \mathbf{Y}, \mathbf{Z}$, and $\mathbf{W}$.
12.2. Draw the structure of $\mathbf{X}, \mathbf{Y}, \mathbf{Z}$ allotropes of phosphorus and sketch the geometry of $\mathbf{X}$.
12.3. $\mathrm{P}_{4}$ ignites suddenly in air at around $35^{\circ} \mathrm{C}$ to form a phosphorus oxide derivative. Thus, it is kept under water. When $\mathrm{P}_{4}$ reacts with different amounts of dry halogens, phosphorus trihalides $\left(\mathrm{PX}_{3}\right)$ or phosphorus pentahalides $\left(\mathrm{PX}_{5}\right)$ are obtained. $\mathrm{PX}_{5}$ can also be obtained by the reaction of the halogens with $\mathrm{PX}_{3}$. The phosphorus pentahalides undergo hydrolysis in two steps to form acid. The phosphoryl halides can be prepared by the hydrolysis of the appropriate pentahalides in a limited amount of water or by the reaction of the trihalides with oxygen. Dropping of the oxide derivative of phosphorus into water produces a hissing sound, heat, and acid product. The reaction of $\mathrm{P}_{4}$ with sodium or potassium hydroxide produces phosphine gas as the major product and potassium or sodium hypophosphite as a by-product. Phosphine burns in chlorine spontaneously, forming a phosphorus trihalide $\left(\mathrm{PX}_{3}\right)$ or phosphorus pentahalide (PX5).
$\underline{\text { Write }}$ the formulas of products $\mathbf{A}-\mathbf{F}$.

When phosphorus reacts with excess of halogens, it can form five-coordinated compounds such as $\mathrm{PCl}_{5}$. Phosphorus mixed pentahalides like $\mathrm{PF}_{2} \mathrm{Cl}_{3}$ are prepared by the addition of one halogen to the phosphorus trihalide of a second halogen.
12.4. Draw the Lewis structures of $\mathrm{PCl}_{5}$ and $\mathrm{PF}_{2} \mathrm{Cl}_{3}$ molecules.
12.5. By using VSEPR theory, predict the molecular geometries of $\mathrm{PCl}_{5}$ and $\mathrm{PF}_{2} \mathrm{Cl}_{3}$.
12.6. Estimate the polarity of $\mathrm{PCl}_{5}$ and $\mathrm{PF}_{2} \mathrm{Cl}_{3}$ molecules.
12.7. Compare the axial $\mathrm{P}-\mathrm{Cl}$ bond length to the equatorial $\mathrm{P}-\mathrm{Cl}$ bond length in $\mathrm{PCl}_{5}$.
12.8. Draw the hybridization scheme of the $\mathrm{PF}_{2} \mathrm{Cl}_{3}$ molecule and estimate which hybrid orbitals are used to form the axial and equatorial bonds.
12.9. The synthesis of $\mathrm{PH}_{3}$ from hydrogen with white phosphorus is given below. Calculate $\Delta \mathrm{H}$ for the following reaction, using bond energies (single bond energies (BE) (in kJ. $\mathrm{mol}^{-1}$ ) for P-P: 213, H-H: 435, P-H: 326).

$$
P_{4}(g)+6 H_{2}(g) \rightarrow 4 P H_{3}(g)
$$

Organophosphorus compounds are organic compounds containing phosphorus. Phosphorus can adopt a variety of oxidation states, and organophosphorus compounds are generally classified based on their derivatives of phosphorus(V) or phosphorus(III), which are the predominant classes of compounds. Organophosphorus compounds are widely used as nucleophiles and ligands. Two major applications are as reagents in the Wittig reaction and as supporting
phosphine ligands in homogeneous catalysis. Their nucleophilicity is evidenced by their reactions with alkyl halides to give phosphonium salts. Phosphines are nucleophilic catalysts in organic synthesis, e.g., the Rauhut-Currier reaction and Baylis-Hillman reaction.

Triphenylphosphine $\left(\mathrm{PPh}_{3}\right)$ is a common organophosphorus compound and it is widely used in the synthesis of organic and organometallic compounds. When a toluene solution of compound $\mathbf{1}$ and excess of $\mathrm{PPh}_{3}$ are heated to reflux, first compound $\mathbf{2}$ is formed and then compound $\mathbf{3}$.

1
Spectral data of compounds 1-3 are given below (for ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR data [ $\delta$ values (relative area)]:

|  | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ |
| :--- | :--- | :--- | :--- |
| ${ }^{1} \mathrm{H}$ NMR | 4.83 | $7.62-7.41(\mathrm{~m}, 15 \mathrm{H})$ | $7.70-7.32(\mathrm{~m}, 30 \mathrm{H})$ |
|  | singlet | $4.19(\mathrm{~m}, 4 \mathrm{H})$ | $3.49(\mathrm{~s}, 4 \mathrm{H})$ |
|  | 224.3 | 231.0 | 237.1 |
|  | 187.2 | 194.9 | 201.8 |
| ${ }^{13} \mathrm{C}$ NMR | 185.3 | 189.9 | 193.8 |
|  | 184.0 | 188.9 | $129.0-134.7$ (several peaks) |
|  | 73.3 | 72.2 | 68.80 |
|  |  | $2038 \mathrm{~cm}^{-1}$ | 1944.0 (several peaks) |
|  | $1958 \mathrm{~cm}^{-1}$ | $1860 \mathrm{~cm}^{-1}$ |  |
| IR |  | $1906 \mathrm{~cm}^{-1}$ | 919.7 |
| MS (m/z) |  | 684.5 |  |

12.10. Identify the structures of $\mathbf{2}$ and $\mathbf{3}$.

Hint: The ${ }^{13}$ C NMR signal of $\mathbf{1}$ at 224.3 ppm is similar to the chemical shift observed for carbene carbons; the peaks between 184 and 202 ppm correspond to carbonyls; and the peak at $\delta 73.3$ is typical for $\mathrm{CH}_{2} \mathrm{CH}_{2}$ bridges in dioxycarbene complexes.
12.11. Determine if $\mathbf{2}$ is more likely to be the facial $(f a c)$ or meridional (mer) isomer.

Hint: The three $v(C O)$ bands with equal intensities are observed in the IR spectrum of compound 2. Protons of the carbene ligand occur as a multiplet in the ${ }^{1} H$ NMR spectrum.
12.12. Determine if $\mathbf{3}$ is more likely to be cis or trans isomer.

Hint: The two $v(C O)$ bands are of approximately equal intensity at 1944 and $1860 \mathrm{~cm}^{-1}$ in the IR spectrum of compound 3 . The ${ }^{31} P$ NMR spectrum shows a single resonance signal.

Some organophosphorus compounds such as sarin, soman, and VX are often referred as "nerve gases" despite the fact that they are liquids at room temperature. Each country signing the 1997 Chemical Weapons Convention agreed to ban the development of chemical weapons and to destroy chemical weapons and associated production facilities by 2012. Sarin can be destroyed by room temperature hydrolysis using aqueous $\mathrm{Na}_{2} \mathrm{CO}_{3}$ to give NaF and the sodium salt of an organophosphate. The hydrolysis of nerve agent VX is more difficult. It reacts slowly with aqueous NaOH at room temperature, and the reaction has to be carried out at 360 K over several hours.

12.13. Determine the organophosphorus salt formed in the following hydrolysis reaction.

Two chromium complexes containing the ligands $\mathrm{CO}, \mathrm{PF}_{3}$, and $\mathrm{PCl}_{3}$ in octahedral geometry are given below. In an octahedral complex, the molecular orbitals created by coordination can be seen as resulting from the donation of two electrons by each of six $\sigma$-donor ligands to the d-
orbitals on the metal, called $\sigma$-bonding. $\pi$-bonding (Pi bonding) in octahedral complexes is also possible when the ligand has $p, d$ or $\pi^{*}$ molecular orbitals available. Ligands such as $\mathrm{CO}, \mathrm{CN}^{-}$ and phosphines (of formula $\mathrm{PR}_{3}$ ) are $\pi$ acceptor, with empty orbitals that can interact with metal d orbitals in a $\pi$ fashion. In most cases, the net back $\pi$ bonding predominates, and electron density is transferred from the metal to the ligand. $\pi$-bonding can affect metal-ligand bond energy and bond length in carbonyl and phosphine complexes.

Answer the following questions considering the $\pi$ interaction.
12.14. In which complex is the $\mathrm{C}-\mathrm{O}$ bond shorter, $\mathrm{Cr}(\mathrm{CO})_{5}\left(\mathrm{PF}_{3}\right)$ or $\mathrm{Cr}(\mathrm{CO})_{5}\left(\mathrm{PCl}_{3}\right)$ ?
12.15. In the infrared spectrum of which complex do the $\mathrm{C}-\mathrm{O}$ stretching bands have higher energy, $\mathrm{Cr}(\mathrm{CO})_{5}\left(\mathrm{PF}_{3}\right)$ or $\mathrm{Cr}(\mathrm{CO})_{5}\left(\mathrm{PCl}_{3}\right)$ ?

## Problem 13. Spinel Oxides

The simple d-block oxides such as $\mathrm{Fe}_{3} \mathrm{O}_{4}$ and $\mathrm{Co}_{3} \mathrm{O}_{4}$ and many related mixed metal compounds have important properties. They have structures related to the mineral spinel, $\mathrm{MgAl}_{2} \mathrm{O}_{4}$, and may be given a general formula of $\mathrm{AB}_{2} \mathrm{O}_{4}$.

Stoichiometric amounts of two aqua complexes of transition metal ( $\mathbf{A}$ and $\mathbf{B}$ ) nitrate salts are thermally reacted to form a spinel $\mathrm{AB}_{2} \mathrm{O}_{4}$ crystalline solid that has a face-centered cubic ( $f c c$ ) structure with a unit cell composition of $8 \mathrm{AB}_{2} \mathrm{O}_{4}$. Depending on the location of these two cations ( A and B ), the spinel structures are divided into two categories as normal and inverse spinels. In a normal spinel, the $\mathrm{A}^{2+}$ ions occupy the tetrahedral holes and the $\mathrm{B}^{3+}$ ions occupy the octahedral holes, but in the inverse spinel structures, the $2+$ ions are replaced by half of the $3+$ ions in the structure.

Crystalline solid has an ordered structure in which the unit cell repeats along all 3 principal axes of a three-dimensional matter. The smallest group of atoms in the material that constitute this repeating pattern is the unit cell of the structure. The unit cell completely reflects the geometry and structure of the entire crystal, which is built up by repetitive translation of the unit cell along the principal axes. Face centered cubic $(f c c)$ is one of a common structure type of crystalline solid. Anions (X) are in the corners and faces of a cube ( $1 / 8$ from each corners and $1 / 2$ from each faces, because the corners and faces are shared by 8 and 2 unit cells, respectively) in the simplest $f c c$ structure. The cations (M) occupy the holes among the anions. There are 8 tetrahedral (corners) and 4 octahedral holes ( 1 at the middle and 3 on the edges, each edge has $1 / 4$ octahedral hole) in a $f c c$ structure. Therefore, the unit cell composition is $\mathrm{M}_{4} \mathrm{X}_{4}$ with an empirical formula of MX. However, the unit cell of a spinel structure is constructed by 8 of these $f c c$ units.

29.746 g salt of $\mathbf{A}$ was mixed with 58.202 g salt of $\mathbf{B}$ in a thermal process to produce 24.724 g pure product, $\mathrm{AB}_{2} \mathrm{O}_{4}$. In the spinel formation process, the metal ion of salt A keeps its oxidation state but the metal ion $\mathbf{B}$ undergoes oxidation. Both salts contain the same number of the water
molecule(s), metal ion, and nitrate ion(s). Elemental analysis of the spinel provided the following data: 6.538 g metal A and 11.786 g metal B . Assume the end product is a diamagnetic solid matter. Considering the information provided above. Answer the following questions.
13.1. Suggest formulas for the salts of $\mathbf{A}$ and $\mathbf{B}$.
13.2. Draw the structure of one of the complex ions i) without and ii) with one of the nitrates being in the coordination sphere as a bidentate ligand and identify if the inversion center is present in the complexes. Inversion is a symmetry operation that translates every atom through the center to the opposite side.
13.3. Place the metal ions in an appropriate location in the crystal structure and suggest if it is a normal or inverse spinel.

The x-ray diffraction data of $\mathrm{AB}_{2} \mathrm{O}_{4}$ provides a unit cell parameter of $8.085 \AA$, which is constructed from $8 f c c$ units and corresponds to a length of the edges of the cube.
13.4. Sketch one of the $f f c$ units of $\mathrm{AB}_{2} \mathrm{O}_{4}$ and place the atoms in the unit.
13.5 What is the density of $\mathrm{AB}_{2} \mathrm{O}_{4}$ ? (hint: $1 \AA$ is $1.0 \times 10^{-10} \mathrm{~m}$ )

Reacting this spinel with other transition metals (M) produces M doped $\mathrm{AB}_{2} \mathrm{O}_{4}$, where M has a choice of occupying the place of either A or B-sides. The side product is AO (mono-oxide of A).
13.6. M is $\mathrm{Mn}^{2+}$ in compound $\mathbf{C}$ and $\mathrm{Ni}^{2+}$ in compound $\mathbf{D}$, suggest the location of $\mathrm{Mn}^{2+}$ and $\mathrm{Ni}^{2+}$ ions in the structure of $\mathbf{C}$ and $\mathbf{D}$, respectively. Assume splitting energy in $\mathrm{Ni}^{2+}$ and $\mathrm{B}^{3+}$ are $11500 \mathrm{~cm}^{-1}$ and $20800 \mathrm{~cm}^{-1}$ in the octahedral field, respectively, and the pairing energy is 19500 $\mathrm{cm}^{-1}$.

If the doping is in a small quantity or in some cases the doped metal ion behaves like a free ion in the lattice (it means, electrons of $M$ only feel the surrounding atoms and localized to M and its 1 shell of atoms in the structure). Assume $\mathrm{Mn}^{2+}$ is behaving like a free ion in the lattice and creating its own localized electronic energy levels.
13.7. Draw the d-orbital splitting and identify if the $\mathrm{Mn}^{2+}$ species are paramagnetic or diamagnetic.

Magnetic susceptibility could be calculated from the spin only formula:

$$
\mu(\text { spin only })=(n(n+2))^{1 / 2},
$$

where n is a number of unpaired electrons. However, some other electronic couplings affect the magnetic moment such that a correction term is needed. The correction term $\alpha$ is related to ground state (where $\alpha=4$ for a non-degenerate and 2 for a degenerate ground state, degeneracy of a ground state can be determined from the electron configurations, such as completely filled and half-filled set of orbitals creates a non-degenerate and a partially filled set of orbitals create degenerate states) and $\lambda=88 \mathrm{~cm}^{-1}$ for $\mathrm{Mn}^{2+}$ and $-315 \mathrm{~cm}^{-1}$ for $\mathrm{Ni}^{2+}$ ), and splitting energy ( $\Delta$ is $5000 \mathrm{~cm}^{-1}$ for $\mathrm{Mn}^{2+}$ and $11500 \mathrm{~cm}^{-1}$ for $\mathrm{Ni}^{2+}$ ) and the magnetic moment is:

$$
\mu_{e f f}=\mu(\text { spin only })\left(1-\frac{a \lambda}{\Delta}\right) .
$$

The magnetic susceptibility can be experimentally determined and it is interrelated with the magnetic moment (if we ignore the diamagnetic contributions) with the following formula:

$$
\mu_{e f f}=2.828\left(X_{m} T\right)^{1 / 2}
$$

where T is temperature in Kelvin and $X_{m}$ is the molar magnetic susceptibility.
13.8. What is the magnetic susceptibility of the products at $25^{\circ} \mathrm{C}$, if the samples C and D weigh 25.433 and 25.471 g , respectively (each obtained from $24.724 \mathrm{~g} \mathrm{AB}_{2} \mathrm{O}_{4}$ )?
13.9. Place all the metal ions ( $\mathrm{A}, \mathrm{B}, \mathrm{Mn}^{2+}$, and $\mathrm{Ni}^{2+}$ ) into their appropriate locations in the lattice and fill up the following table. Use $\mathrm{t}_{2 \mathrm{~g}}$ for $\mathrm{d}_{\mathrm{xy}}, \mathrm{d}_{\mathrm{xz}}$, and $\mathrm{d}_{\mathrm{yz}}$ and $\mathrm{e}_{\mathrm{g}}$ for $\mathrm{d}_{\mathrm{x} 2-\mathrm{y} 2}, \mathrm{~d}_{\mathrm{z2}}$ orbitals in octahedral $\left(\mathrm{O}_{\mathrm{h}}\right)$ and $\mathrm{t}_{2}$ and e orbitals in tetrahedral $\left(\mathrm{T}_{\mathrm{d}}\right)$ cases. If there is distortion, predict the type of distortion(s) and show the d-orbital splitting.

| M | Local <br> geometry | Electron <br> configuration | Degeneracy | Type of <br> distortion |
| :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |

## Problem 14. Platinum Complexes as Anticancer Drugs

Medicinal inorganic chemistry based on metal-based drugs is broadly defined as the area of research related to metal ions and metal complexes and their clinical applications. It is a new research area that developed from the discovery of the anticancer agent cisplatin. Cisplatin, cisdiamminedichloroplatinum(II), is a yellow powder and an anticancer drug widely used in the treatment of a variety of tumors, especially those of the testes, ovaries, head, and neck.

The synthesis of cisplatin starts with $\mathrm{K}_{2}\left[\mathrm{PtCl}_{4}\right]$, but has undergone several improvements since it was published more than 100 years ago. The main problem is the occurrence of impurities and the formation of the by-product trans-platin. Nowadays, the synthetic routes are mostly based on a method published in the 1970s by Dhara. In the initial step, $\mathrm{K}_{2}\left[\mathrm{PtCl}_{4}\right]$ is reacted with excess KI, and the platinum complex is converted into the iodo analogue (A). Subsequently, $\mathrm{NH}_{3}$ is added to the compound $\mathbf{A}$ and compound $\mathbf{B}$ is formed by ligand exchange in which two $\mathrm{NH}_{3}$ ligands are exchanged with two iodo ligands. $\mathbf{B}$ is a yellow solid that is filtered, dried, and mixed with the aqueous solution of $\mathrm{AgNO}_{3}$. The insoluble AgI can be filtered off and cisdiamminediaquaplatinum(II) nitrate $(\mathbf{C})$ is formed; then excess KCl is added to the solution of C to yield cisplatin (D).

The success of the synthesis relies on the strong trans effect of the iodo ligands. The spectator ligands T that are trans to the leaving group in square-planar complexes influence the rate of substitution. This phenomenon is called the trans effect. Key point is that a strong $\sigma$-donor ligand or $\pi$-acceptor ligand greatly accelerates substitution of a ligand situating in the trans position. Trans effects follow the order given below.

For a T $\sigma$-donor: $\mathrm{OH}^{-}<\mathrm{NH}_{3}<\mathrm{Cl}^{-}<\mathrm{Br}^{-}<\mathrm{CN}^{-}, \mathrm{CH}_{3}^{-}<\mathrm{I}^{-}<\mathrm{SCN}^{-}<\mathrm{PR}_{3}, \mathrm{H}^{-}$
For a T $\pi$-acceptor: $\mathrm{Br}^{-}<\mathrm{I}^{-}<\mathrm{NCS}^{-}<\mathrm{NO}_{2}^{-}<\mathrm{CN}^{-}<\mathrm{CO}, \mathrm{C}_{2} \mathrm{H}_{4}$

14.1. Write the formulas of $\mathbf{A}-\mathbf{D}$.
14.2. Draw molecular structures of A-D.
14.3. Is the complex $\mathbf{D}$ polar?
14.4. Sketch the d-orbital splitting of cisplatin complex D in view of Crystal Field Theory and show the electron distribution diagram.
14.5. Determine magnetic nature of complex $\mathbf{A}$.

The platinum complex binds to DNA and causes cross-linking, which triggers the programmed cell death (apoptosis). However, the other geometrical isomer of the square planar structure transplatin, trans-diamminedichloroplatinum(II) (F), is not effective for the treatment of cancer. Transplatin is synthesized starting from $\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{4}\right]^{2+}$ to which the first and second $\mathrm{Cl}^{-}$ligands are added to form transplatin $(\mathbf{F})$ as represented in the scheme below.

14.6. Draw the molecular structures of $\mathbf{E}$ and $\mathbf{F}$.

The most important classes of antitumor agents, cisplatin, carboplatin, and oxaliplatin as platinum(II) diamines are widely used in chemotherapy to treat a wide variety of cancers.

Carboplatin

Oxaliplatin

However, the therapeutic index of these agents is relatively narrow; their use is often plagued with severe toxicity and the development of resistance, which leads to disease progression. Recently, oxoplatin, iproplatin, ormaplatin and satraplatin are Pt complexes that have been used clinically (oxoplatin) or in clinical trials.

Oxoplatin

Iproplatin

Ormaplatin

Satraplatin
14.7. All complexes have the same geometry and oxidation number for the Pt central atom.
$\underline{\text { Write the oxidation state of } \mathrm{Pt} \text { and geometry of the complexes. }}$
14.8. Which Pt complex, cisplatin or satraplatin, is kinetically more inert for substitution reactions?
14.9 Oxaplatin is an isomer of $\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{2} \mathrm{Cl}_{2}(\mathrm{OH})_{2}\right]$ complex. Draw all stereoisomers and indicate the chiral one(s).

Platinum complexes (oxoplatin, iproplatin, ormaplatin, and satraplatin) can be considered prodrugs that are primarily intracellularly activated by biological reducing agents such as thiols, ascorbic acid, and glutathione (GSH) to kill cancer cells.

In a study, for example, the reduction of cis, trans, cis- $\left[\mathrm{PtCl}_{2}\left(\mathrm{OCOCH}_{3}\right)_{2}\left(\mathrm{NH}_{3}\right)_{2}\right]$ ( $\mathbf{G}$, prodrug), which has a similar structure to satraplatin, by aqueous extract of cancer cells (A2780, A2780cisR, and HT-29) yields cisplatin (D, drug) and free acetate ion as given below.

14.10. Draw the molecular structure of $\mathbf{G}$.
14.11. Sketch the d-orbital splitting of the metal ion in $\mathbf{G}$ and write the electronic configuration.
14.12. Decide whether $\mathbf{G}$ is paramagnetic or diamagnetic.
14.13. The complex $\mathbf{G}$ crystallizes into a monoclinic crystal system of parameters: the lengths of the unit cell: $a=14.9973, b=8.57220, c=11.1352 \AA$, the $\beta$ angle in the unit cell $=126.7690^{\circ}$, the number of the molecules in the unit cell $(\mathrm{Z})=4, M=436.16 \mathrm{~g} / \mathrm{mol}$ (the complex has one water molecule in the crystal structure).

Calculate the density ( $\rho$ ) of the complex.

Hint: the volume of a monoclinic crystal unit cell is $V=a \times b \times c \times \sin \beta$

## Problem 15. Sodium Compounds from Salt

The Salt Lake basin in Turkey is of great importance for the conservation of biological diversity and is classed as a wetland according to international criteria. It is also one of Turkey's richest lakes for the presence of birds. There are 85 bird species, 129 insect species ( 4 of which are endemic), 15 mammal species, and 38 endemic plant species. Some $40 \%$ of Turkey's salt needs (as table salt) are supplied from this lake. Salt in the Salt Lake is formed by meteorological waters draining underground and melting the previously formed salt domes and carrying them along the tectonic lines. Salt production in the Salt Lake is done by evaporation of lake water under the sun. A pooling system is used in the salt production with solar energy.

Salt Lake

Table salt is one of the most common household chemicals. It is $97 \%$ to $99 \%$ sodium chloride, which is an ionic compound with the chemical formula NaCl , representing a 1:1 ratio of sodium and chloride ions. NaCl is the compound most responsible for the salinity of seawater and of the extracellular fluid of many multicellular organisms. In its edible form of table salt, it is commonly used as a condiment and food preservative. A second major application of sodium chloride is de-icing of roadways in subfreezing weather. Large quantities of sodium chloride are also used in many industrial processes such as the chloro-alkaline industry and soda-ash industry as well as in miscellaneous industrial uses: water softening, medicine, agriculture, firefighting, and cleanser. NaCl is used, directly or indirectly, in the production of many sodium compounds, which consume most of the world's production. The scheme below shows the preparation of some sodium compounds starting from NaCl .

Preparation of some sodium compounds starting from NaCl .

### 15.1. Write the formulas of products $\mathbf{A}-\mathbf{G}$.

Sodium carbonate $\left(\mathrm{Na}_{2} \mathrm{CO}_{3}\right.$, soda ash) is used primarily in the manufacture of glass, which is produced mostly from natural sources, such as the mineral trona, $\mathrm{Na}_{2} \mathrm{CO}_{3} \cdot \mathrm{NaHCO}_{3} \cdot \mathrm{nH}_{2} \mathrm{O}$. It can be also manufactured mostly from $\mathrm{NaCl}, \mathrm{CaCO}_{3}$, and $\mathrm{NH}_{3}$ using a process introduced by the Belgian chemist Ernest Solvay in 1863. The key step involves the reaction of $\mathrm{NH}_{3}(\mathrm{~g})$ and $\mathrm{CO}_{2}(\mathrm{~g})$ in saturated $\mathrm{NaCl}(\mathrm{aq})$. Of the possible ionic compounds that could precipitate from such a mixture $\left(\mathrm{NaCl}, \mathrm{NH}_{4} \mathrm{Cl}, \mathrm{NaHCO}_{3}\right.$, and $\left.\mathrm{NH}_{4} \mathrm{HCO}_{3}\right)$, the least soluble is sodium hydrogen carbonate (sodium bicarbonate, $\mathrm{NaHCO}_{3}$ ). It is isolated from solution by filtration and then converted to sodium carbonate $\left(\mathrm{Na}_{2} \mathrm{CO}_{3}\right)$ by heating. According to this explanation,
15.2. Balance the reactions given below.
$\mathrm{NaCl}(\mathrm{aq})+\mathrm{CO}_{2}(g)+\mathrm{NH}_{3}(g)+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow$
$2 \mathrm{NaHCO}_{3}(\mathrm{~s}) \xrightarrow{\Delta}$
15.3. Using $\mathrm{CaCO}_{3}$ (limestone), how can you produce the $\mathrm{CO}_{2}$ gas you need to prepare $\mathrm{NaHCO}_{3}$ ?
15.4. Write the Lewis structure of $\mathrm{CaCO}_{3}$ with all resonances and show formal charges for each atom in the structure.
15.5. Describe the molecular geometry and propose a plausible hybridization scheme for the central atom in the ion $\mathrm{CO}_{3}{ }^{2-}$.
15.6. Compare the bond lengths of $\mathrm{CO}_{3}{ }^{-2}, \mathrm{CO}$, and $\mathrm{CO}_{2}$ in increasing order.

NaCl crystallizes in a face-centered cubic (fcc) structure. The density of NaCl is $2180 \mathrm{~kg} / \mathrm{m}^{3}$ and the ionic radius of $\mathrm{Na}^{+}$is 99 pm .
15.7. How many atoms are there in the unit cell? Which atoms occupy octahedral holes?
15.8. Calculate the length of the unit cell of NaCl and the ionic radius of the $\mathrm{Cl}^{-}$ion (as pm ).
15.9. The alkali metals react rapidly with oxygen to produce several different ionic oxides. Under appropriate conditions, generally by carefully controlling the supply of oxygen, the oxide $\mathrm{M}_{2} \mathrm{O}$ can be prepared for each of the alkali metals. Lithium reacts with excess oxygen to give $\ldots .$. (A).... and a small amount of $\ldots \ldots$.(B)....... Sodium reacts with excess oxygen to give mostly $\ldots$. (C) $\ldots$... and a small amount of $\ldots$. .(D)........Potassium, rubidium, and cesium react

Fill in the blanks above (for $\mathbf{A - G}$ ) with convenient formulas of metal oxides.
15.10. Draw the Lewis structures of oxide, peroxide, and superoxide ions.
15.11. Draw the molecule orbital energy level diagram of peroxide and superoxide ions and compare their bond lengths and energies.

When $\mathrm{LiClO}_{4}, \mathrm{NaClO}_{4}$, and $\mathrm{KClO}_{4}$ crystallize from an aqueous solution that may or may not contain water molecules called water of crystallization as part of the solid structures, although no simple rule exists for predicting with certainty whether the ions will retain all or part of their hydration spheres in the solid state, cations with high charge densities tend to retain all or part of their hydration spheres in the solid state. When the cations have low charge densities, the cations tend to lose their hydration spheres; thus, they tend to form anhydrous salts. The ionic radius of $\mathrm{Li}^{+}, \mathrm{Na}^{+}$, and $\mathrm{K}^{+}$is $76 \mathrm{pm}, 102 \mathrm{pm}$, and 138 pm , respectively.
15.12. Calculate the charge densities of the ions in $\mathrm{C} \mathrm{mm}^{-3}$.
15.13. Which perchlorate salt is most susceptible to form an anhydrous compound?

## Problem 16. Thermal Springs of Turkey and Sulfur Chemistry

Turkey is one of the 7 countries in the world in terms of thermal source richness with almost 1300 thermal springs throughout Anatolia. There are thermal hotels in many cities such as Ankara, Bursa, Balıkesir, Yalova, Erzurum, Sivas and Afyonkarahisar. Afyonkarahisar, located in the Aegean region, is the most famous city in Turkey for its thermal springs. The thermal waters of Afyonkarahisar contain over 42 different minerals and many trace elements. The most concentrated ones are sulfur, calcium, chloride, sodium, and carbonates. Among these minerals, sulfur is important as "nature's beauty mineral" because the human body needs it to manufacture collagen, which keeps human skin elastic, beautiful, and young looking. Moreover, sulfur is used to minimize the symptoms of many skin diseases including dermatitis, eczema, dandruff, and warts. People with arthritis may obtain pain relief from taking a soothing bath in thermal sulfur springs. Mineral water containing sulfur compounds is also shown to decrease cholesterol and blood pressure. Therefore, sulfur chemistry is an important topic. In this question, you will explore sulfur chemistry by studying its different reactions and compounds.

Sulfur is extracted as the element from underground deposits. It has many allotropes and its allotropy is complicated, but the most common sulfur allotrope is the puckered rings of $S_{8}$ (orthorhombic sulfur, $\alpha$-form).
16.1. Sketch the molecular structure of $S_{8}$ and indicate whether the molecule has a horizontal mirror plane or not.

Upon the burning of $\mathbf{S}_{8}$ with oxygen, compound $\mathbf{A}$ is produced. Further catalytic oxidation of compound $\mathbf{A}$ yields compound $\mathbf{B}$. The reaction of $\mathbf{A}$ and $\mathbf{B}$ with water (hydrolysis) yields $\mathbf{C}$ and D. Compound $\mathbf{D}$ is an oxoacid and a central substance of the chemical industry worldwide.
16.2. Write the formulas of compounds A-D.
16.3. Draw molecular shape of the compounds by giving the name of geometries.
16.4. Write the oxidation state of the sulfur atoms in $\mathbf{C}$ and $\mathbf{D}$.
16.5. Give balanced chemical equations for the synthesis of $\mathbf{A}-\mathbf{D}$.

Compound $\mathbf{A}$ can also be obtained by heating alkaline or alkaline earth sulfide minerals like CaS in an excess of air.
16.6. Write the balanced chemical equation for the synthesis of $\mathbf{A}$ from CaS .

Upon the reaction of $\mathbf{D}$ and $\mathbf{B}$, compound $\mathbf{E}$ which is a dense and corrosive liquid that is used as a basic chemical for sulfonation processes is produced.
16.7. Give a balanced chemical equation for the synthesis of $\mathbf{E}$ from $\mathbf{D}$.
16.8. Write molecular formula and draw the molecular shape of $\mathbf{E}$.
16.9. Determine the oxidation state of the sulfur atoms in $\mathbf{E}$.

The reaction of $\mathrm{S}_{8}$ with a stoichiometric amount of chlorine gas yields compound $\mathbf{F}$ and the further reaction of $\mathbf{F}$ with excess chlorine gas results in the formation of $\mathbf{G}$, which is used as a precursor for the synthesis of sulfur dyes and synthetic rubber. The reaction of $\mathbf{G}$ with $\mathbf{B}$ yields the compounds $\mathbf{H}$ and $\mathbf{A} . \mathbf{H}$ is a toxic compound used as the chlorinating agent in organic synthesis.
16.10. Write molecular formulas and draw the molecular shapes of $\mathbf{F}, \mathbf{G}$, and $\mathbf{H}$.
16.11. Give balanced chemical equations for the synthesis of compounds $\mathbf{F}, \mathbf{G}$, and $\mathbf{H}$.

One of the most common naturally occurring sulfur minerals is pyrite ( $\mathrm{FeS}_{2}$ : iron(II) disulfide), called fool's gold because it is a brass-yellow mineral and thus most people suppose that it is gold ore. The treatment of pyrite with hydrochloric acid results in the formation of a colorless, flammable, water-soluble gas with a "rotten egg" odor, compound $\mathbf{I}$. Compound $\mathbf{I}$ is dissolved
in thermal waters for spa applications since it is reported that the therapeutic effects of thermal water are directly correlated to its sulfur concentration. Compound $\mathbf{I}$ is slightly heavier than air and can be detected by lead(II) acetate paper strip test in which a reaction occurs between lead(II) acetate and $\mathbf{I}$, producing compound $\mathbf{J}$. Moreover, upon the oxidation of $\mathbf{I}$, compound $\mathbf{A}$ can be yielded.
16.12. Write the molecular formulas of $\mathbf{I}$ and $\mathbf{J}$.
16.13. Draw the molecular shape of $\mathbf{I}$ and write the name of the shape.
16.14. Give balanced chemical equations for the synthesis of $\mathbf{I}$ and $\mathbf{J}$.

The sulfur oxoacids are chemical compounds that contain sulfur, oxygen, and hydrogen atoms. Sulfur has several oxoacids; one of them is thiosulfuric acid, with the molecular formula $\mathbf{H}_{2} \mathbf{S}_{2} \mathrm{O}_{3}$, which can be synthesized by the reaction of sulfite with $\mathbf{I}$. On the other hand, the controlled oxidation of sulfite by $\mathrm{MnO}_{2}$ in acidic solution yields another sulfur oxoacid, called dithionic acid, $\mathbf{H}_{2} \mathbf{S}_{2} \mathrm{O}_{6}$.
16.15. Give balanced chemical equations for the synthesis of $\mathrm{H}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ and $\mathrm{H}_{2} \mathrm{~S}_{2} \mathrm{O}_{6}$.
16.16. Draw the molecular shapes of $\mathrm{H}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ and $\mathrm{H}_{2} \mathrm{~S}_{2} \mathrm{O}_{6}$.

On the other hand, the thiosulfate ion $\left(\mathrm{S}_{2} \mathrm{O}_{3}{ }^{2-}\right)$ is a very good complexing agent for $\mathrm{Ag}^{+}$and thus it is used in photography for removing unchanged AgBr from exposed photographic film. Upon the reaction of sodium thiosulfate ion with AgBr , sodium salt of a coordination compound with coordination number 2 is yielded.
16.17. Give a balanced chemical equation for the reaction of AgBr with $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$.
16.18. Draw the molecular structure of the yielded coordination complex considering its geometry.
16.19. Write the electron configuration of the silver ion in the coordination compound.

The determination of $\mathrm{H}_{2} \mathrm{~S}$ content in thermal waters is important for spa applications. An iodometric titration method can be utilized for this purpose. In a typical experiment, 500 mL of sample is collected from a thermal water source and purged with $\mathrm{N}_{2}(\mathrm{~g})$ to ensure the transfer of all $\mathrm{H}_{2} \mathrm{~S}$ gas into 50 mL of 0.010 M NaOH solution in a closed system. After adjusting pH of the solution to $6.0,1.25 \mathrm{~mL}$ of $0.0030 \mathrm{M} \mathrm{I}_{2}$ solution and 1.0 g of KI are added to this solution and the resultant solution is stored in the dark for 15 minutes after sealing it with parafilm. After
adding 1.0 mL of $20 \mathrm{mg} / \mathrm{mL}$ starch solution, the resultant solution is titrated with 0.0500 M $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ until the end-point and consumed $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ volume is recorded as 95.62 mL .
16.20. Write all balanced equations of this experiment.
16.21. Calculate $\mathrm{H}_{2} \mathrm{~S}$ concentration in the thermal water source in ppm by assuming that there is no interfering species in the water source and all $\mathrm{H}_{2} \mathrm{~S}$ content of thermal water is swept into the NaOH solution.

## Problem 17. Electrochemical Determination of Rutin

Flavonoids are a group of natural products with some phenolic groups that are present in many fruits and vegetables. Flavonoids are commonly used in our daily life due to their antioxidant and anticarcinogenic properties. Rutin is a flavonoid class substance composed of the flavonol quercetin and disaccharide rutinose.

Chemical structure of rutin.

It is of very low toxicity for human health and it is known that rutin can supply electrons to reactive free radicals to produce more stable and healthy structures. Rutin is also known as vitamin P , in which P is due to its permeability. Rutin is an electrochemically active material and many researchers have extensively studied its electrochemical behavior using different electrochemical techniques.

Cyclic voltammetry is a useful technique for electrochemical measurement of an analyte, which is dissolved in a useful electrolyte solution. There are three electrodes in an electrochemical cell solution; working, counter, and reference electrodes. The potential of working electrode is scanned versus reference electrode because reference electrode has a constant potential value. Reverse electrochemical reactions of the working electrode occur at the counter electrode. Therefore, current flows between working and counter electrodes. Reference electrode is used to adjust the potential of the working electrode at a known value. This technique is applied based on potentiodynamic application. Potential of the working electrode is scanned versus reference electrode between two potential values depending on time. Cyclic voltammetry application results in a graphic (voltammogram) of current versus scanned potential. There are two important parameters to evaluate a voltammogram; peak potential and peak current. The
peak potential and peak current are calculated using $x$-axis and $y$-axis of a voltammogram at the peak maximum, respectively.

The cyclic voltammetry (CV) behavior of rutin at $25^{\circ} \mathrm{C}$ has been tested using a glassy carbon electrode, a saturated calomel electrode (SCE), and a Pt wire as working, reference, and counter electrodes, respectively. In this study, CV data for $1.0 \times 10^{-4} \mathrm{~mol} / \mathrm{dm}^{3}$ rutin solutions at different pH values have been obtained by scanning the potential between 0.00 and 0.80 V at a scan rate of $100 \mathrm{mV} / \mathrm{s}$. Anodic peak potential $\left(\mathrm{Ep}_{\mathrm{a}}\right)$, cathodic peak potential $\left(\mathrm{Ep}_{\mathrm{c}}\right)$, anodic peak current $\left(\mathrm{Ip}_{\mathrm{a}}\right)$, and cathodic peak current $\left(\mathrm{Ip}_{\mathrm{c}}\right)$ values supplied from related CVs depending on the pH are presented in the following Table.

Table. Some CV parameters depending on the pH of a solution containing $1.0 \times 10^{-4} \mathrm{~mol} / \mathrm{dm}^{3}$ rutin.

| $\mathbf{p H}$ | $\mathbf{E p}_{\mathbf{a}} / \mathbf{m V}$ | $\mathbf{E p}_{\mathbf{c}} / \mathbf{m V}$ | $\mathbf{I p}_{\mathbf{a}} / \boldsymbol{\mu} \mathbf{A}$ | $\mathbf{I p}_{\mathbf{c}} / \boldsymbol{\mu} \mathbf{A}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1.5 | 643 | 614 | 0.105 | -0.104 |
| 2.0 | 609 | 578 | 0.118 | -0.119 |
| 3.0 | 544 | 514 | 0.116 | -0.117 |
| 4.0 | 499 | 470 | 0.104 | -0.104 |
| 5.0 | 441 | 410 | 0.093 | -0.092 |
| 6.0 | 372 | 344 | 0.099 | -0.100 |

17.1. In a three-electrode system, electrochemical oxidation or reduction of an analyte in the electrochemical cell occurs on the $\qquad$ because its potential is adjusted against the $\qquad$ .

Which of the following words fit into the blanks in the above sentence?
a) working electrode / reference electrode
b) counter electrode / working electrode
c) reference electrode / working electrode
d) working electrode / counter electrode
17.2. Both anodic and cathodic peak potentials shift to negative potential values by increasing the pH because the electrochemical reaction of rutin includes $\qquad$ .

Which of the following words fits into the blank in the above sentence?
a) $\mathrm{Na}^{+}$
b) $\mathrm{K}^{+}$
c) $\mathrm{H}^{+}$
d) $\mathrm{I}^{-}$
17.3. Electrochemical oxidation of rutin is $\qquad$ because of the fact that $\mathrm{Ip}_{\mathrm{a}} / \mathrm{Ip}_{\mathrm{c}}$ is about 1 and $\Delta \mathrm{Ep}$ is almost $0.0592 / \mathrm{n} \mathrm{V}$.

Which of the following words fits into the blank in the above sentence?
a) irreversible
b) reversible
c) quasi-reversible
d) catalyzed
17.4. How long does it take to obtain each CV value?
17.5. Calculate the number of transferred electrons for the electrochemical reaction of rutin including $2 \mathrm{H}^{+}$.
17.6. Propose an electrochemical redox mechanism for rutin.
17.7. The SCE reaction is $\mathrm{Hg}_{2} \mathrm{Cl}_{2}(s)+2 e^{-} \rightarrow 2 \mathrm{Hg}(l)+2 \mathrm{Cl}^{-}$and the SCE contains saturated KCl solution prepared by dissolving 342 g of KCl in 1.0 L of aqueous solution. How does the potential of the SCE change (decrease or increase) in the case of 1.0 M KCl ?

In order to determine the amount of rutin in a vitamin P tablet, the following procedures have been used:
i) A 500 mg vitamin P tablet is dissolved in deionized water, pH is adjusted to 2.0 , and total volume is completed to 500 mL in a volumetric flask. A 10 mL part of this solution is placed in a three-electrode cell. CV is obtained with an anodic peak current $\left(\mathrm{Ip}_{\mathrm{a}}\right)$ of $2.26 \mu \mathrm{~A}$.
ii) A solution in the absence of rutin has been prepared at pH 2.0 . After placing all electrodes into this solution, CV has been recorded three times by cleaning the electrode with deionized water for each measurement. Then $\mathrm{Ip}_{\mathrm{a}}$ values have been read as $0.16,0.11$, and $0.18 \mu \mathrm{~A}$, respectively.
iii) The standard rutin solutions of $1.0,5.0,10.0,20.0,30.0$, and 50.0 mM have been prepared and $\mathrm{Ip}_{\mathrm{a}}$ values of these solutions have been obtained from related CVs as demonstrated in the following Table.

Table. $\mathrm{Ip}_{\mathrm{a}}$ values for various rutin standard solutions.

| $\mathbf{C}_{\text {rutin }} / \mathbf{m M}$ | $\mathbf{I} \mathbf{p}_{\mathrm{a}} / \boldsymbol{\mu} \mathbf{A}$ |
| :---: | :---: |
| 1.0 | 1.11 |
| 5.0 | 6.43 |
| 10.0 | 12.62 |
| 20.0 | 24.73 |
| 30.0 | 36.20 |
| 50.0 | 58.55 |

Note that all of the CVs have been obtained by using same working electrode beyond this experiment.
17.8. Draw a calibration curve for the rutin determination method.
17.9. Write a mathematical equation for the calibration curve.
17.10. Calculate the rutin amount in the vitamin $P$ tablet as wt $\%$.
17.11. Calculate the calibration sensitivity and limit of detection (LOD) of this method for a signal to noise ratio $(\mathrm{S} / \mathrm{N})$ of 3.0.

Note: Limit of detection: $\quad L O D=\frac{k \times s_{\text {blank }}}{m}$

## Problem 18. Particle in a Box Problem: Free Electron Model

The particle in an one-dimensional box model is a crude approximation for conjugated molecules. In this model, $\pi$ electrons are assumed to move freely over the carbon framework of conjugated bonds. Therefore, this model is also called the free electron model (FEM). The length of the box may be approximated via $L=n_{C} \times 1.40 \AA$, where L is the box length and $n_{C}$ is the number of carbons. Furthermore, the Pauli principle is applied when electrons are filled to the energy levels. The energy of a particle in an one-dimensional box can be written as follows:

$$
E_{n}=\frac{n^{2} h^{2}}{8 m L^{2}}
$$

where $m$ is the mass of the particle, $h$ is the Planck constant, and $n$ is a positive integer.

For the 1,3,5,7-octatetraene molecule assuming FME:
18.1. Draw an energy diagram, fill the electrons, and calculate orbital energies.
18.2. Calculate the total $\pi$ energy of the molecule.
18.3. Determine the wave length of the light (in nm ) that require to excite an electron from the highest occupied molecular orbital (HOMO) to the lowest unoccupied molecular orbital (LUMO).

For two-dimensional conjugated systems, we may use the particle in a two-dimensional box model. In this case the total energy can be written as follows:

$$
E_{n_{1}, n_{2}}=\frac{h^{2}}{8 m}\left(\frac{n_{1}^{2}}{L_{1}^{2}}+\frac{n_{2}^{2}}{L_{2}^{2}}\right)
$$

where $L_{1}$ and $L_{2}$ are the lengths and $n_{1}$ and $n_{2}$ are the quantum numbers of the first and second dimensions, respectively.

Graphene is a sheet of carbon atoms in the form of a two-dimensional hexagonal lattice in which one atom forms each vertex.

For a square shaped graphene sheet with $L_{1}=L_{2}=11 \AA$ :
18.4. The distance between two adjacent carbons in the hexagonal 6-carbon unit is approximately $1.4 \AA$. Calculate the number of electrons in a ( $11 \AA \times 11 \AA$ ) sheet of graphene. For this problem you may ignore edge electrons. (Area of a regular hexagon with a side of $L$ is $A=\frac{3 \sqrt{3}}{2} L^{2}$ ).
18.5. Calculate the energy of the HOMO.
18.6. Calculate the energy of the LUMO.
18.7. The difference between energies of the LUMO and HOMO is called the band gap $\left(E_{g}\right)$. Calculate the band gap.

The models for a particle in a one- and two-dimensional box can be extended to a threedimensional rectangular box of dimensions $L_{1}, L_{2}$, and $L_{3}$, yielding the following expression for the allowed energy levels:

$$
E_{n_{1}, n_{2}, n_{3}}=\frac{h^{2}}{8 m}\left(\frac{n_{1}^{2}}{L_{1}^{2}}+\frac{n_{2}^{2}}{L_{2}^{2}}+\frac{n_{3}^{2}}{L_{3}^{2}}\right)
$$

where $n_{1}, n_{2}$, and $n_{3}$ are the quantum numbers of the first, second, and third dimensions, respectively. For a particle in a cubic box of length $L$ :
18.8. Give the expressions for the five different lowest energies.
18.9. Draw a diagram showing all the five energy levels. Indicate degeneracy of each level.

## Problem 19. Harmonic Oscillator and Rigid Rotor Models

Vibration of a diatomic molecule is reminiscent of two masses on a spring with a potential energy that is a function of the displacement from equilibrium. Hence, the harmonic oscillator model is utilized to compute vibrational frequencies. These frequencies are called harmonic vibrational frequencies. The energy of a harmonic oscillator can be written as follows:

$$
E_{n}=h v\left(n+\frac{1}{2}\right)
$$

where $v$ is the harmonic vibrational frequency, $h$ is the Planck constant, and $n$ is a nonnegative integer. The harmonic vibrational frequency can be calculated as follows:

$$
v=\frac{1}{2 \pi} \sqrt{\frac{k}{\mu}}
$$

where $k$ is the force constant and $\mu$ is the reduced mass:

$$
\mu=\frac{m_{1} m_{2}}{m_{1}+m_{2}}
$$

where $m_{1}$ and $m_{2}$ are the masses of the first and the second atoms, respectively.

For the ${ }^{12} \mathrm{C}^{16} \mathrm{O}$ molecule the value of the force constant is $1902.4 \mathrm{~N} / \mathrm{m}$. For this problem, the atomic masses of isotopes can be approximated by their mass numbers.
19.1. Calculate the harmonic vibrational frequency of the ${ }^{12} \mathrm{C}^{16} \mathrm{O}$ molecule in Hz .
19.2. Express the harmonic vibrational frequency of the ${ }^{12} \mathrm{C}^{16} \mathrm{O}$ molecule in $\mathrm{cm}^{-1}$.
19.3. Calculate the zero-point vibrational energy (ZPVE) of the ${ }^{12} \mathrm{C}^{16} \mathrm{O}$ molecule in $\mathrm{kcal} / \mathrm{mol}$.
19.4. Calculate the harmonic vibrational frequency of the ${ }^{13} \mathrm{C}^{16} \mathrm{O}$ molecule in $\mathrm{cm}^{-1}$.
19.5. Calculate the harmonic vibrational frequency of the ${ }^{12} \mathrm{C}^{17} \mathrm{O}$ molecule in $\mathrm{cm}^{-1}$.

The harmonic oscillator model can readily be extended to polyatomic molecules. In this case, the total vibrational energy of a molecule with $n_{\text {freq }}$ vibrational frequencies can be written as follows:

$$
E_{n_{1} n_{2} \ldots n_{n_{\text {freq }}}}=h \sum_{i=1}^{n_{\text {freq }}} v_{i}\left(n_{i}+\frac{1}{2}\right)
$$

where $v_{i}$ are the harmonic vibrational frequencies, $h$ is the Planck constant, and $n_{i}$ are nonnegative integers.

For the water molecule the harmonic vibrational frequencies are 1649,3832 , and $3943 \mathrm{~cm}^{-1}$. Using the harmonic oscillator model, for the water molecule:
19.6. Calculate the ZPVE value (in J and $\mathrm{cm}^{-1}$ units).
19.7. Calculate the first 5 energy levels (in $\mathrm{cm}^{-1}$ ).

To describe the rotational motion of a diatomic molecule, the rigid rotor model is used. In this model the bond length $(R)$ of the diatomic molecule is kept constant during the rotational motion. Using the rigid rotor model, the rotational energy of a diatomic molecule can be written as follows:

$$
E_{l}=\frac{h^{2}}{8 \pi^{2} I} l(l+1)
$$

where $I$ is the moment of inertia and $l$ is a nonnegative integer. The moment of inertia can be written as follows:

$$
I=\mu R^{2}
$$

where $\mu$ is the reduced mass and $R$ is the bond length of the diatomic molecule.
In the microwave spectrum of the ${ }^{12} \mathrm{C}^{16} \mathrm{O}$ molecule the value of frequency for the lowest energy transition is 115.270 GHz .
19.8. Calculate the bond length of the ${ }^{12} \mathrm{C}^{16} \mathrm{O}$ molecule in $\AA$ A.
19.9. For the ${ }^{12} \mathrm{C}^{16} \mathrm{O}$ molecule predict the frequency of the next two absorptions (selection rule is $\Delta l= \pm 1$ ).
19.10. For the ${ }^{12} \mathrm{C}^{17} \mathrm{O}$ molecule, calculate the frequency of the lowest energy absorption.

## Problem 20. Journey to Different Earth-Like Planets

In the future, humankind will most likely consume all resources that are necessary for life on earth and will have to relocate to an earth-like planet. Assume that you have started to live on a new planet where standard pressure condition is 2 bar , standard concentration is $1 \mathrm{~mol} \mathrm{dm}^{-3}$, and all types of gases behave as an ideal gas. On this planet, you are asked to determine equilibrium conditions for the reaction below:

$$
X Y_{4}(g) \rightleftharpoons X(s)+2 Y_{2}(g)
$$

$\Delta_{r} S^{\circ}=80 \mathrm{JK}^{-1} \mathrm{~mol}^{-1}$ at 298 K
20.1. Calculate the change in standard enthalpy of the reaction at 298 K by using the following information:

$$
\begin{array}{cl}
X_{4} Y_{8}(s) \rightarrow 4 X(s)+4 Y_{2}(g) & \Delta_{r} H_{1}^{\circ}=123.34 \mathrm{~kJ} \mathrm{~mol}^{-1} \\
Y_{2}(g)+X_{4} Y_{6}(l) \rightarrow X_{4} Y_{8}(s) & \Delta_{r} H_{2}^{\circ}=-48.48 \mathrm{~kJ} \mathrm{~mol}^{-1} \\
X_{4} Y_{6}(l) \rightarrow 2 X_{2} Y_{3}(g) & \Delta_{r} H_{3}^{\circ}=32.84 \mathrm{~kJ} \mathrm{~mol}^{-1} \\
X_{2} Y_{3}(g)+1 / 2 Y_{2}(g) \rightarrow X(s)+X Y_{4}(g) & \Delta_{r} H_{4}^{\circ}=-53.84 \mathrm{~kJ} \mathrm{~mol}^{-1}
\end{array}
$$

20.2. Calculate $\Delta_{\mathrm{r}} \mathrm{G}^{\circ}$ of the reaction at 298 K .
20.3. Calculate $\mathrm{K}^{\circ}$ of the reaction at 298 K .
20.4. Assume that $\Delta_{r} H^{\circ}$ of the reaction does not depend on temperature. Find $K$ of the reaction at $50^{\circ} \mathrm{C}$.
20.5. Calculate the percent degree of dissociation for $\mathrm{XY}_{4}$ at 298 K where total pressure is 0.2 bar.
20.6. In order to increase the amounts of products, which one do you choose to increase (if you choose both, put a cross next to both of them):

| $\square$ | pressure |
| :--- | :--- |
| $\square$ | temperature of the reaction vessel |

Moreover, in this future, the Earth will have a very unstable climate. The surface temperature could increase or decrease all of a sudden. Suppose that you travelled through time to the era in which the Earth's climate is extremely unstable. Your task in this era is to observe the thermodynamics of phase transitions of water, the most precious substance where all life has originated. Suppose that the temperature suddenly decreased to $-20^{\circ} \mathrm{C}$.

One mole of water becomes supercooled liquid water at $-20^{\circ} \mathrm{C}$ and 1 bar pressure and then turns into ice at the same temperature (note that the temperature of the surroundings is constant at $-20^{\circ} \mathrm{C}$ ).

By using the following data for water:

The heat of fusion $\left(\Delta_{\mathrm{m}} \mathrm{H}^{\circ}\right)$ of ice at $0^{\circ} \mathrm{C}$ and 1 bar is $6020 \mathrm{~J} \mathrm{~mol}^{-1}$
$C_{p, m}\left(\mathrm{H}_{2} \mathrm{O}(\mathrm{s})\right)=37.7 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$
$C_{p, m}\left(\mathrm{H}_{2} \mathrm{O}(\mathrm{l})\right)=75.3 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}$

During the conversion of supercooled liquid water to ice at $-20^{\circ} \mathrm{C}$ :
20.7. Calculate the total entropy change in the system.
20.8. Calculate the total entropy change in the surroundings.
20.9. Calculate the total entropy change in the universe.
$\Delta \mathrm{S}=C_{p} \ln \frac{T_{\text {final }}}{T_{\text {initial }}}$ and $\Delta \mathrm{S}=-\frac{q_{\text {transition }}}{T}$

## Problem 21. Rate Constant Models and Kinetic Isotope Effect

Transition state theory (TST) is a very helpful model to explain the reaction rates of elementary chemical reactions. The TST assumes a quasi-equilibrium between reactants and transition state.

Reaction: $\mathrm{HO}^{-}+\mathrm{CH}_{3} \mathrm{Cl} \longrightarrow\left[\mathrm{HO}---\mathrm{CH}_{3}----\mathrm{Cl}\right]^{\ddagger} \longrightarrow \mathrm{CH}_{3} \mathrm{OH}+\mathrm{Cl}^{-}$

Similar to the Arrhenius model, the TST proposes the following temperature-dependent rate constant expression:

$$
k_{T S T}=\frac{k_{B} T}{h} \exp \left[-\frac{\Delta G^{\ddagger}}{R T}\right]
$$

where, $k_{B}$ is the Boltzmann constant, $h$ is the Planck constant, and $\Delta G^{\ddagger}$ is the activation free energy.

The TST rate constant introduces a simple temperature-dependent factor instead of Arrhenius factor $A$. Further, the TST model allows us to better understand the activation energy concept and build a bridge between the theory and experiment. Moreover, the TST activation free energy is a temperature dependent parameter instead of Arrhenius temperature independent $E_{a}$.

For the decomposition of an organic compound obeying first-order reaction kinetics, the following rate constant values are obtained at given temperatures:

| $\boldsymbol{t}\left({ }^{\circ} \boldsymbol{C}\right)$ | 10 | 30 | 50 | 70 |
| :--- | :--- | :--- | :--- | :--- |
| $\boldsymbol{k} / \mathbf{1 0}^{-4}\left(\boldsymbol{s}^{-\boldsymbol{I}}\right)$ | 1.1408 | 17.2075 | 185.5042 | 1515.7157 |

21.1. Using the Arrhenius model, calculate the activation energy.
21.2. Calculate the Arrhenius factor $A$.
21.3. Calculate the half-life of the organic compound at $75^{\circ} \mathrm{C}$.
21.4. Assume that the rate constants provided obey the TST model, instead of the Arrhenius model. Then, calculate activation free energy at $30^{\circ} \mathrm{C}$.
21.5. Assume that the rate constant obtained from both Arrhenius and TST models are equal to each other. Then, derive expressions for activation enthalpy and entropy in terms of the activation energy and the Arrhenius factor.
21.6. Using the expressions obtained, $\underline{\text { calculate }}$ the activation enthalpy at $80^{\circ} \mathrm{C}$.

The kinetic isotope effect (KIE) is the change in the reaction rate of a chemical reaction when one of the atoms in the reactants, generally hydrogen, is replaced by one of its isotopes, generally deuterium. KIE is generally utilized in organic chemistry in a procedure called as "deuterium labelling" by changing one or more hydrogen(s) with deuterium(s).

One of the common theoretical approaches to explain KIE is the primary KIE. In the primary KIE approach, it is assumed that the change in reaction rate is a quantum chemical effect that primarily results from heavier isotopes having lower vibrational frequencies compared to their lighter counterparts. Hence, one may assume that the TST model is valid, and the change in the activation free energy arises solely from the change in the zero-point vibrational energies (ZPVEs). Therefore, we may write the following equation:

$$
\frac{k_{H}}{k_{D}}=\frac{\exp [(Z P V E(R, H)-Z P V E(T S, H)) / R T]}{\exp [(Z P V E(R, D)-Z P V E(T S, D)) / R T]}
$$

where $k_{H}$ and $k_{D}$ are the rate constants of reactions including hydrogen and deuterium, respectively, $Z P V E(R, H)$ and $Z P V E(R, D)$ are the ZPVE values of the reactants including hydrogen and deuterium, respectively, and $\operatorname{ZPVE}(T S, H)$ and $Z P V E(T S, D)$ are the ZPVE values of TSs including hydrogen and deuterium, respectively.

For a thermal decomposition of an organic compound, the difference between ZPVE values of deuterium including TS (TS-D) and hydrogen including TS (TS-H) is $-2.3 \mathrm{~kJ} / \mathrm{mol}$. Further, the ZPVE value of hydrogen including reactant $(\mathrm{R}-\mathrm{H})$ is $3.0 \mathrm{~kJ} / \mathrm{mol}$ higher than that of deuterium including reactant (R-D).
21.7. Calculate the $\frac{k_{H}}{k_{D}}$ value at 298.15 K .
21.8. Calculate the $\frac{k_{H}}{k_{D}}$ value at 330.0 K .
21.9. If the rate constant $k_{H}$ is $2.5 \times 10^{2}$ and $k_{D}$ is $2.2 \times 10^{2}$, then what is the temperature.

## Problem 22. Parallel Reaction Kinetics

The reaction in which a reactant undergoes two or more independent reactions concurrently is called a parallel or competing reaction. Dehydration of ethanol, nitration of phenol, and nitration of benzene are examples of parallel reactions. The reaction given below is an example of a parallel first-order reaction.

22.1. For the parallel first-order reactions of $\mathbf{A}$ given above, find the concentrations of $\mathbf{B}$ and $\mathbf{C}$ as an equation depending on initial $\mathbf{A}$ concentration at time $t$ after the start of the reaction. Find the ratio of $\mathbf{B}$ concentration to $\mathbf{C}$ concentration.

$$
\text { Hint: } \int e^{a x} d x=\frac{1}{a} e^{a x}+c
$$

22.2. The effective rate constant $\left(k_{e f f}\right)$ for the decomposition of $\mathbf{A}$ can be defined as $\left(k_{1}+k_{2}\right)$. Assume that the effective rate constant satisfies the Arrhenius equation. Write the expression for the effective activation energy $\left(E_{A, e f f}\right)$ in terms of $\mathrm{k}_{1}, \mathrm{k}_{2}, \mathrm{E}_{\mathrm{a}, 1}$, and $\mathrm{E}_{\mathrm{a}, 2}$ and estimate the $E_{A, \text { eff }}$ for the given values $\left(\mathrm{k}_{1}=6.2 \mathrm{~min}^{-1}, \mathrm{k}_{2}=3.2 \mathrm{~min}^{-1}, \mathrm{E}_{\mathrm{a}, 1}=35 \mathrm{~kJ} \mathrm{~mol}^{-1}\right.$, and $\left.\mathrm{E}_{\mathrm{a}, 2}=60 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)$.

$$
H i n t: \frac{d}{d x} e^{a x}=a \cdot e^{a x}
$$

Calculate the half-life for the effective rate constant $\left(t_{1 / 2}(e f f)\right)$.
22.3. If $\mathrm{k}_{1}$ and $\mathrm{k}_{2}$ values of the given parallel first-order reactions of $\mathbf{A}$ are 6.2 and $3.2 \mathrm{~min}^{-1}$, respectively, at 278 K , find the temperature for the production of equimolar concentrations of $\mathbf{B}$ and $\mathbf{C}$. ( $\mathrm{E}_{\mathrm{a}}$ energies for the formation of $\mathbf{B}$ and $\mathbf{C}$ are 35 and $60 \mathrm{~kJ} \mathrm{~mol}^{-1}$, respectively).
22.4. Draw symbolic concentration change curves for $[A],[B]$, and $[C]$ if $k_{1}>k_{2}$.

22.5. The reaction given below is an example of parallel-consecutive first-order reactions with a reversible step.

The following data are given for this reaction:
$\mathrm{k}_{1}=0.109 \mathrm{~min}^{-1}, \mathrm{k}_{2}=0.0752 \mathrm{~min}^{-1}, \mathrm{k}_{3}=0.0351 \mathrm{~min}^{-1}, \mathrm{k}_{4}=0.0310 \mathrm{~min}^{-1}$.

| Time $(\mathrm{min})$ | $\theta_{A, t}(\mathrm{~min})$ | $\theta_{B, t}(\mathrm{~min})$ |
| :--- | :--- | :--- |
| 12.9 | 6.89 | 3.79 |

$\theta_{A, t}=\int_{0}^{t} \frac{[A]}{[A]_{0}} d t \quad \theta_{B, t}=\int_{0}^{t} \frac{[B]}{[A]_{0}} d t$

Find the $[A],[B],[C]$ concentrations after 12.9 minutes if $[A]_{0}=5 \mathrm{~mol} \mathrm{dm}^{-3}$.

## Problem 23. Reaction Kinetics with Absorbance Measurement

It is often experimentally convenient to use an analytical method that provides an instrumental signal that is proportional to concentration, rather than providing an absolute concentration. Absorbance, fluorescence intensity, and conductance are examples of this type of instrument response. The requirements are that the reactants and products both give a signal that is directly proportional to their concentrations and there is an experimentally usable change in the observed property as the reactants are transformed into the products. In this experiment, absorption spectroscopy and Beer's law can be used.
$\mathbf{A}$ is the reactant and $\mathbf{B}$ is the only product $(\mathbf{A} \rightarrow \mathbf{B})$ and both give an absorbance at selected wavelength that is directly proportional to their concentrations. In this experiment, $\varepsilon_{A} \neq \varepsilon_{B}$, where $\varepsilon$ is the molar absorptivity.

For the hydrolysis of $\mathbf{A}$ to $\mathbf{B}$ in aqueous solution, the absorbance-time data are given in the Table below. The experimental conditions: pH of the medium is 7.0 and temperature is $25^{\circ} \mathrm{C}$. The initial A concentration is $4.0 \times 10^{-6} \mathrm{M}$ and measurements are recorded at 400 nm in a $5-\mathrm{cm}$ cell.

| $\mathbf{t} / \mathbf{s}$ | $\mathbf{A t}_{\mathbf{t}}$ |
| :---: | :---: |
| 0 | 0.0840 |
| 20 | 0.1090 |
| 60 | 0.1515 |
| 120 | 0.2010 |
| 160 | 0.2255 |
| 200 | 0.2440 |
| $\infty$ | 0.3170 |

23.1. Calculate the molar absorptivities of $\mathbf{A}$ and $\mathbf{B}$ under these conditions.
23.2. Find the rate constant.
23.3. Find the half-life $\left(\mathrm{t}_{1 / 2}\right)$.
23.4. After how many seconds [A] is equal to $1.0 \times 10^{-6} \mathrm{M}$ ?
23.5. If $k$ is equal to $0.01029 \mathrm{~s}^{-1}$ at $30^{\circ} \mathrm{C}$, calculate $E_{a}$.
23.6. Assuming that the transition state rate constant is equal to one obtained from the experimental data, calculate activation free energy.

$$
k_{T S T}=\frac{k_{B} T}{h} e^{-\Delta G^{\ddagger} / R T}
$$

where $k_{B}$ is the Boltzmann constant, $h$ is Planck's constant, and R is the universal gas constant.

The condensation reaction of acid catalyzed ethylene glycol and terephthalic acid is monitored as a function of extent of the reaction ( p : ratio of condensed $[\mathrm{A}]$ to $[\mathrm{A}]_{0}$ ) and the reaction obeys second-order kinetics. The concentration of each monomer is equal to each other and it is $[\mathrm{A}]_{0}=4.8 \mathrm{~mol} \mathrm{dm}^{-3}$.

Terephthalic acid
Polyethylene terephthalate

| Time $(\mathrm{h})$ | Extent of Reaction |
| :--- | :--- |
| 0 | 0 |
| 0.5 | 0.636 |
| 1.5 | 0.839 |
| 2.5 | 0.897 |

23.7. Find the rate constant.
23.8. Find the half-life of the reaction.
23.9. What will the monomer concentration be after one hour?

## Problem 24. Acridine Orange / DNA Binding Interactions

Acridine orange (AO) is a fluorescent dye that binds to DNA via an intercalative mode of binding. AO can insert itself into the DNA base pairs. Interactions of intercalating agents such as AO with DNA have been widely studied, and complexation can be followed with spectrometric titrations by varying the DNA-to-dye ratio. Stock solutions of DNA can be standardized spectrophotometrically ( $\varepsilon=13,200 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{~cm}^{-1}$ at 260 nm for a molar DNA concentration, $C_{\text {DNA }}$, expressed in base pairs.)
24.1. Give an expression to calculate the pure DNA concentration from an absorbance reading at 260 nm from a UV spectrum of solution containing DNA (quartz cuvette length: 1.0 cm ).

The interaction between DNA and AO to form the AO-DNA complex can be expressed by the following reaction:

$$
A O+D N A \rightleftharpoons A O-D N A
$$

whose equilibrium constant is

$$
\begin{equation*}
\mathrm{K}=\frac{[\mathrm{AO}-\mathrm{DNA}]}{[\mathrm{AO}][\mathrm{DNA}]} \tag{1}
\end{equation*}
$$

Where [DNA], [AO] and [AO-DNA] are equilibrium concentrations.
24.2. Provide a mass balance expression for the overall AO concentration ( $C_{\mathrm{AO}}$ ) at equilibrium conditions.

Binding of AO to DNA can be followed by recording fluorescence intensity $(F)$. Both AO and AO-DNA complex display a maximum emission intensity at $\lambda_{\mathrm{em}}=520 \mathrm{~nm}$. In dilute solutions, concentration is proportional to F . Therefore, quantitative estimation of complexation can be determined by using $F$.

$$
F=\varphi_{i} \times C_{i}
$$

where $\varphi_{i}$ is the fluorescence constant and $C_{i}$ is the concentration for species $i$.
24.3. Provide an expression for the overall $F$ in terms of $\varphi$ and concentrations of $A O$ and of DNA at equilibrium.

Consider that initially there is only AO in the measuring cell displaying an emission at $\lambda_{\mathrm{em}}=$ 520 nm , and finally at equilibrium both AO and $\mathrm{AO}-$ DNA complex have emission at the same wavelength. $\mathrm{F}-\varphi_{\mathrm{AO}} C_{\mathrm{AO}}=\Delta \mathrm{F}$, and $\varphi_{\mathrm{AO}-\mathrm{DNA}} \varphi_{\mathrm{AO}}=\Delta \varphi$ is given.

### 24.4. Show that $\Delta F=[A O-D N A] \Delta \varphi$.

The binding equilibrium constant for AO intercalation to DNA (ignore AO self-aggregation and dimerization) can be determined from the equation:

$$
\begin{equation*}
\frac{C_{\mathrm{AO}}}{\Delta \mathrm{~F}}=\frac{1}{\Delta \varphi}+\frac{1}{\Delta \varphi K} \frac{1}{[D N A]} \tag{2}
\end{equation*}
$$

24.5. Derive equation (2) starting from equation (1).

Spectrofluorometric titration is performed by adding increasing amounts of the DNA directly into the cell containing the AO. Each time DNA is added, the fluorescence intensity at $\lambda_{\mathrm{em}}=$ 520 nm , where only free and bound AO have emission, is recorded.

| $C_{\mathrm{AO}}\left(\mathrm{mol} \mathrm{dm}^{-3}\right)$ | $C_{\mathrm{DNA}}\left(\mathrm{mol} \mathrm{dm}^{-3}\right)$ | $\mathrm{F}_{520}$ (a.u.) ${ }^{*}$ |
| :--- | :--- | :--- |
| $1.857 \times 10^{-7}$ | $6.535 \times 10^{-6}$ | 162 |
| $1.832 \times 10^{-7}$ | $1.032 \times 10^{-5}$ | 188 |
| $1.800 \times 10^{-7}$ | $1.521 \times 10^{-5}$ | 210 |
| $1.725 \times 10^{-7}$ | $2.671 \times 10^{-5}$ | 240 |
| $1.604 \times 10^{-7}$ | $4.516 \times 10^{-5}$ | 260 |

* a.u. is arbitrary unit
24.6. Calculate the equilibrium binding constant for AO-DNA using the data given in the Table above. Assume that there is no AO self-aggregation or dimerization. Take $\varphi_{A O}=5.00 \times 10^{8} \mathrm{~mol}$ $\mathrm{dm}^{-3}$, and $[\mathrm{DNA}] \cong C_{\mathrm{DNA}}$.

24.7. Given that $K=e^{-\frac{\Delta G^{\circ}}{R T}}$ and the plot above, calculate the values of $\Delta \mathrm{rH}^{\circ}, \Delta \mathrm{r} \mathrm{S}^{\circ}$, and $\Delta \mathrm{rG}{ }^{\circ}$ for the complexation of AO with DNA at $25^{\circ} \mathrm{C}$. (Assume that $\Delta \mathrm{rH}{ }^{\circ}$ and $\Delta \mathrm{rS}{ }^{\circ}$ do not change with the temperature.)

AO can undergo some self-aggregation (dimerization) at higher concentrations. The quantitative analysis of the dimerization can be expressed as follows:

$$
2 \mathrm{D} \stackrel{k_{\mathrm{f}}}{\stackrel{k_{\mathrm{d}}}{\rightleftharpoons}} \mathrm{D}_{2}
$$

Here $D$ represents AO monomer while $D_{2}$ represents dimeric AO, and $k_{\mathrm{f}}$ and $k_{\mathrm{d}}$ are the rate constants for dimer formation and dimer dissociation, respectively. According to that reaction, AO concentration dependence of the relaxation time, $\tau$, which represents the time passed for a system to reach the new equilibrium when a sudden change is applied, is expressed by the relationship:

$$
\frac{1}{\tau}=k_{\mathrm{d}}+4 k_{\mathrm{f}} C_{A O}
$$

Data for dimerization of AO at $25^{\circ} \mathrm{C}$ are given in the Table below.

| $10^{6} C_{\mathrm{AO}}\left(\mathrm{mol} \mathrm{dm}^{-3}\right)$ | $10^{5}$ Relaxation time, $\tau(\mathrm{s})$ |
| :--- | :--- |
| 2.50 | 2.32 |
| 4.50 | 2.27 |
| 8.00 | 2.18 |
| 11.0 | 2.11 |

### 24.8. Calculate the values of $k_{\mathrm{d}}$ and $k_{\mathrm{f}}$.

The absorbance spectra of AO derivative at various concentrations ( 0 to $7.3 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}$ ) in water are shown in the Figure below. The spectra indicate that two absorbance peaks exist: one at 496 nm and the other at 475 nm . The inset gives the ratio of absorbance peaks ( $\mathrm{A}_{475} / \mathrm{A}_{496}$ ) as a function of AO concentration.

24.9. Choose correct statement(s) according to the absorbance spectra of the $A O$ derivative.

The band observed at 496 nm is attributed to the monomeric form.
If there were only the monomeric form, the ratio of absorbance peaks $\left(\mathrm{A}_{475} / \mathrm{A}_{496}\right)$ would remain constant.
$\square \quad$ To reduce dimerization, the concentration of AO should be reduced.
24.10. If the initial concentration of AO is $1.0 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}$, then calculate the dimer fraction at equilibrium.

$$
2 \mathrm{D} \stackrel{k_{\mathrm{f}}}{\stackrel{k_{\mathrm{d}}}{\rightleftharpoons}} \mathrm{D}_{2}
$$

## Problem 25. Spectrophotometric Determination of an Antihistaminic Drug

Spectrophotometric procedures are simple, rapid, and accurate methods that can be utilized for the determination of drug molecules. The method is based on formation of a complex between two reagents. Many complexes are colored and absorb in the visible region; thus they can be determined spectrophotometrically.

An antihistaminic drug, $D$, acts as an electron donor group and complexes with a $\pi$-acceptor, $S$. Absorbance of the resulting complexes recorded at relevant maxima ( 460 nm ) with respect to drug concentration shows a linear tendency with good correlation coefficients.

$$
\begin{gathered}
D+S \rightleftharpoons D S \\
K=\frac{[D S]}{[D][S]}
\end{gathered}
$$

where [DS], [D], and [S] represent the equilibrium concentrations of the $D S$ complex, $D$, and $S$, respectively.

$$
C_{D}=[D]+[D S]
$$

where $C_{\mathrm{D}}$ is the overall concentration of the drug.

At a wavelength where only the formed $D S$ complex absorbs light, the following expression holds:

$$
A=\varepsilon_{D S} l[D S]
$$

where $l$ is the length of the measuring cuvette.
The binding equilibrium constant of the complexation can be calculated using the BenesiHildebrand equation, which depends on the experimental conditions where one of the component species should be present in large excess so that its concentration is not altered on formation of complex.

$$
\frac{C_{\mathrm{D}}}{A_{\mathrm{DS}}}=\frac{1}{\varepsilon_{\mathrm{DS}}}+\frac{1}{\varepsilon_{\mathrm{DS}} \mathrm{~K}} \times \frac{1}{C_{\mathrm{S}}}
$$

where $C_{\mathrm{S}}$ and $C_{\mathrm{D}}$ are total concentrations of $S$ and $D . A_{\mathrm{DS}}$ is the absorbance of the complex, $\varepsilon_{\mathrm{DS}}$ is the molar absorptivity of the complex, and $K$ is the equilibrium constant.

25.1. Considering the Benesi-Hildebrand plot recorded at $25^{\circ} \mathrm{C}$, find the equilibrium constant for the complex formation and molar absorptivity of the complex.
25.2. The initial equal concentration of $D$ and $S$ is $9 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}$. Calculate the fraction of the complex formed when equilibrium is reached. Consider there is a $1: 1$ molar ratio between $D$ and $S$ in the complexation.
25.3. Calculate the $\Delta \mathrm{rG}^{\circ}$ in $\mathrm{kJ} \mathrm{mol}^{-1}$ at $25^{\circ} \mathrm{C}$.

The kinetics of complexation of $D$ with $S$ is studied by varying temperature ( 25,45 , and $60^{\circ} \mathrm{C}$ ). The Table gives the rate constant of complexation at different temperatures.

| $\mathrm{T}\left({ }^{\circ} \mathrm{C}\right)$ | $\mathrm{k}\left(\mathrm{min}^{-1}\right)$ |
| :---: | :---: |
| 25 | 0.0200 |
| 45 | 0.0504 |
| 60 | 0.0944 |

25.4. Calculate the activation energy, $E_{\mathrm{a}}$.
25.5. Given that $k_{T S T}=\frac{k_{B} T}{h} e^{-\frac{\Delta G^{\ddagger}}{R T}}$, $\underline{\text { calculate }}$ the activation enthalpy $\left(\Delta \mathrm{H}^{\ddagger}\right)$, activation entropy $\left(\Delta S^{\ddagger}\right)$, and free activation enthalpy $\left(\Delta \mathrm{G}^{\ddagger}\right)$ of the reaction for $25^{\circ} \mathrm{C}$.

## Part II: <br> Practical Problems

## Safety

Participants in the Olympiad must be prepared to work in a chemical laboratory and be aware of all relevant rules and safety procedures. The organizers will strictly enforce the safety rules given in Appendix A of the IChO Regulations during the Olympiad.

The Preparatory Problems are designed to be carried out in properly equipped chemical laboratories under competent supervision only. For each chemical, the GHS hazard and precautionary numbers are reported. We did not include specific and detailed safety and disposal instructions as regulations are different in each country. Mentors must carefully adapt the problems accordingly.

## A Material Safety Data Sheet (MSDS)

A Material Safety Data Sheet (MSDS) is a technical document that contains detailed and comprehensive information about the hazards of a chemical and how to work safely with the chemical product. You have to know about the hazards with the chemicals in experiments.

## Dress code

During the examination, the students will be required to wear:

- pants covering their whole legs;
- closed and flat shoes;
- a lab coat with long sleeves;
- if applicable, long hair tied back.

Safety glasses will be supplied and must be carried during the whole examination, even if the student wears prescription glasses. Contact lenses are prohibited.

## Any student that fails to respect these rules will not be allowed to enter the lab.

The GHS hazard statements (H-phrases) associated with the materials used are indicated in the problems. Their meanings are as follows.

Definition of GHS hazard statements:

## Physical hazards

H224 Extremely flammable liquid and vapour.
H225 Highly flammable liquid and vapour.

H226 Flammable liquid and vapour.
H272 May intensify fire; oxidizer.
H290 May be corrosive to metals.
H290 May be corrosive to metals.

## Health hazards

H301 Toxic if swallowed.
H302 Harmful if swallowed.
H302 + H312 + H332 Harmful if swallowed, in contact with skin or if inhaled.
H304 May be fatal if swallowed and enters airways.
H311 Toxic in contact with skin.
H312 Harmful in contact with skin.
H312 + H332 Harmful in contact with skin or if inhaled.
H314 Causes severe skin burns and eye damage.
H315 Causes skin irritation.
H317 May cause an allergic skin reaction.
H318 Causes serious eye damage.
H319 Causes serious eye irritation.
H330 Fatal if inhaled.
H334 May cause allergy or asthma symptoms or breathing difficulties if inhaled.
H335 May cause respiratory irritation.
H336 May cause drowsiness or dizziness.
H340 May cause genetic defects.
H350 May cause cancer.
H360FD May damage fertility. May damage the unborn child.
H372 Causes damage to organs through prolonged or repeated exposure.

## Environmental hazards

H400 Very toxic to aquatic life.
H410 Very toxic to aquatic life with long lasting effects.
H411 Toxic to aquatic life with long lasting effects.
H412 Harmful to aquatic life with long lasting effects.

## Precautionary Statements

P201 Obtain special instructions before use.
P210 Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking.
P221 Take any precaution to avoid mixing with combustibles, heavy-metal compounds, acids and alkalis.
P260 Do not breathe dust or mist.

P261 Avoid breathing dust/ fume/ gas/ mist/ vapours/ spray.
P264 Wash skin thoroughly after handling.
P273 Avoid release to the environment.
P280 Wear protective gloves.
P280 "Wear protective gloves/ protective clothing/ eye protection/ face
protection."
P301 + P310 + P331 IF SWALLOWED: Immediately call a POISON CENTER/doctor. Do NOT induce vomiting.
P301 + P312 + P330 IF SWALLOWED: Call a POISON CENTER/doctor if you feel unwell.
Rinse mouth.
P301 + P330 + P331 IF SWALLOWED: Rinse mouth. Do NOT induce vomiting.
P302 + P352 IF ON SKIN: Wash with plenty of water.
P302 + P352 + P312 "IF ON SKIN: Wash with plenty of water. Call a POISON
CENTER/doctor if you feel unwell."
P303 + P361 + P353 "IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water."
P304 + P340 IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing.
P304 + P340 + P310 "IF INHALED: Remove person to fresh air and keep comfortable for breathing. Immediately call a POISON CENTER/doctor."
P304 + P340 + P312 "IF INHALED: Remove person to fresh air and keep comfortable for breathing. Call a POISON CENTER/doctor if you feel unwell."
P305 + P351 + P338 IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
P305 + P351 + P338 + P310 IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER/doctor.
P308 + P310 IF exposed or concerned: immediately call a POISON CENTER or doctor/ physician.
P314 Get medical advice/ attention if you feel unwell.
P337 + P313 If eye irritation persists: Get medical advice/ attention.
P370 + P378 "In case of fire: Use dry sand, dry chemical or alcohol-resistant foam to extinguish."
P403 + P233 Store in a well-ventilated place. Keep container tightly closed.
P403 + P235 Store in a well-ventilated place. Keep cool.

## Risk and Safety Statements

R 51/53 Toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment.
S 61 Avoid release to the environment. Refer to special instructions/ Safety data sheets.

## Problem P1. Drug Delivery from a Polymeric Hydrogel System

Chemical structure of paracetamol.

Nowadays, studies in the field of medicine aim to reduce the drug dose to a minimum, extend the dose range, and improve the quality of life by ensuring that the patient is not affected by the side effects of the drug. "Controlled release systems" provide the best response to this goal. Controlled release is a system that can be prepared in membrane or matrix form. Controlled release of a drug from systems such as a hydrogel film or sphere allows the drug to be more effectively introduced into the body.

Paracetamol is a drug active substance with analgesic and antipyretic properties. It is one of the most common drugs used to reduce moderate/mild pain and fever.

In this problem, you will examine the controlled release of paracetamol active substance from a hydrogel polymer system.

## Chemicals

| Substance | Name | State | GHS Hazard <br> Statements |

## Glassware and Equipment

- 1 Beaker, 100 mL
- 1 Graduated cylinder, 100 mL
- 1 Volumetric pipette, 5 mL
- 1 Volumetrik flask with stopper, 250 mL
- 5 Volumetric flasks with stoppers, 10 mL
- 1 Pipette filler bulb
- 1 Spatula (small)
- 6 Test tubes with plastic caps
- 1 Weighing dish
- 1 Petri dish
- 1 Glass rod
- 1 Wash bottle
- 1 Magnetic hotplate stirrer
- 1 Stopwatch
- 15 Disposable plastic pipette, 3 mL
- 2 Sheets of millimetric paper
- 1 Ruler
- 1 Felt-tip pen for glassware
- 1 Photometer
- 2 UV-vis quartz (or quality plastic, <200 nm) absorption cuvettes
- 1 Balance
- 1 stirring bar
- 1 marker
- 1 thermometer
- 1 Vortex
- 1 Hot air gun
- Vials
- Water bath
- Syringe
- Plastic Straws

Preparation of pH: 7.4 PBS: Prepare 150 mL of distilled water in a 250 mL flask. Add 1.6 g $\mathrm{NaCl}, 0.4 \mathrm{~g} \mathrm{KCl}, 288 \mathrm{mg} \mathrm{Na}_{2} \mathrm{HPO}_{4}$, and $48 \mathrm{mg} \mathrm{NaH}_{2} \mathrm{PO}_{4}$. Add distilled water until volume is 250 mL and mix to dissolve all salts in the solution.

## Preparation of Hydrogel

1. Weigh different amounts of AA monomer ( $5 \mathrm{~mL}, 72.9 \mathrm{mmol}$ ), MBAA ( $0.026 \mathrm{~g}, 0.17 \mathrm{mmol}$ ) as crosslinker, paracetamol (known amount), APS ( $0.1 \mathrm{~g}, 0.44 \mathrm{mmol}$ ) as initiator in a vial (20 mL ), add deionized water ( 5.0 mL ).
2. Use a vortex or magnetic stirrer to help dissolve the mixture in the vial.
3. Fill into pipettes with the aid of a syringe (the bottom of the paper pipettes is previously closed with a hot air gun).
4. Place in a hot water bath at $60^{\circ} \mathrm{C}$ for polymerization of these mixtures in pipettes.
5. Remove the polymerized gels from the paper pipettes, and divide them into equal pieces.

## Part A. Plotting the Calibration Curve

In this section, you are asked to prepare the standard solutions of paracetamol as seen in Table 1. After reading the absorbance (A) values of each solution by using a UV-Vis spectrophotometer, fill in the blanks in Table 1.

Table 1. Data of paracetamol standards.

| $\mathbf{C}_{\text {paracetamol }}(\mathbf{m g} / \mathbf{L})$ | Absorbance at $\mathbf{2 4 3} \mathbf{~ n m}$ |
| :---: | :---: |
| 2 |  |
| 4 |  |
| 6 |  |
| 8 |  |
| 10 |  |

## Procedure

1. Go to the millimetric paper page.
2. Write the standard paracetamol concentrations on the $x$-axis and the corresponding absorbance values on the $y$-axis. Write the units of the axes.
3. Pass a straight line over the points and determine the equation of this calibration graph. If you have any problem to obtain the linearity between absorbance and concentration, you can repeat the experiment till you obtain a linear line.
4. Find the calibration equation.

## Part B. Release of Paracetamol from the Polymeric Hydrogel System

## Procedure

1. Turn on the magnetic hotplate stirrer and put a 250 mL beaker on it. Add 100 mL of PBS solution into beaker and adjust temperature of the solution to $37^{\circ} \mathrm{C}$ using a thermometer.
2. Stir the solution at 250 rpm .
3. Place the hydrogel sample provided to you into the beaker. Using a glass rod, allow hydrogel to be in the solution (release solution) using a glass rod.
4. At different time intervals $(0,10,20,30,40$, and 50 min ), place 2 mL of the release solution into different test tubes, seal each tube with a plastic cap, and add 2 mL of PBS solution to the release solution in each case.
5. Read the absorbance at 243 nm for all solutions you collected. Use PBS solution as blank.
6. Fill in the following Table 2.

Table 2. Data for the release of paracetamol from the hydrogel system depending on time.

| Time (min) | Absorbance (A) |
| :---: | :--- |
| 0 |  |
| 10 |  |
| 20 |  |
| 30 |  |
| 40 |  |
| 50 |  |

## Calculations \& Analysis

In this section, the release behavior of paracetamol from the hydrogel system will be examined. Use the absorbance values in Table 2 and the calibration equation.

P1.1. Calculate the cumulative drug release using the following equation:

Cumulative drug release ratio $=\frac{v_{1} X c_{i}+v_{2} \sum\left(c_{i-1}\right)}{m} \times 100 \%$

In this equation:
$v_{1}$ : total volume of PBS solution ( 100 mL ), $c_{i}$ : concentration in the release medium, $v_{2}$ : volume of the measured sample ( 2 mL ), m : mass of paracetamol in the hydrogel.

Table 3. Experimental data.

| Time (min) | Paracetamol concentration | Cumulative drug release (\%) |
| :---: | :--- | :--- |
| 0 |  |  |
| 10 |  |  |
| 20 |  |  |
| 30 |  |  |
| 40 |  |  |
| 50 |  |  |

P1.2. Using another sheet of millimetric paper, record the release times $(t=0,10,20,30,40,50$ min ) on the x -axis and the cumulative drug release values on the y -axis. Pass a straight line through the points.

P1.3. Calculate the time (in minutes) required to take $20 \%$ of paracetamol from this hydrogel system for an individual person suffering from pain using the graphic of Table 3.

## Problem P2. Determination of the Total Carbon Content of Oltu Stone (Black Amber) Samples

Erzurum is a city in the northeastern part of Anatolia and is called the peak of Turkey due to its high altitude of 1900 m . Erzurum has a unique black stone (Oltu stone, black amber). This stone has been carved since the $18^{\text {th }}$ century to produce jewelry and different souvenirs. Different products of Oltu stone such as rings, earrings, necklaces, bracelets, tie pins, smoking pipes, cigarette holders, and prayer beads are produced by polishing and are sold in Taşhan (Rustem Pasha Caravanserai) Bazaar in Erzurum, which was established in 1561.

There are around 600 active quarries mining Oltu stone. The beds are about 80 cm in thickness and form by diastrophism and folding of fossilized trees. Oltu stone is soft when excavated but begins to harden when it is exposed to the air. It is generally black but can be dark brown, gray, or greenish too. Oltu stone is an important material for the electric and electronics industries because its graphite-like carbon black nature. Therefore, Oltu stone contains plenty of the element carbon.

This task aims to quantitatively determine the amount of carbon in Oltu stone samples thanks to back titration, using dichromate solution. Carbon element in the sample is first oxidized to $\mathrm{CO}_{2}(\mathrm{~g})$ with dichromate and then excess dichromate is back titrated with a standard iron(II) sulfate solution.

Note: This experiment can also be performed using another carbon-rich material such as coal or pencil graphite instead of Oltu stone.

Caution: Potassium dichromate $\left(\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}\right)$ is a very strong oxidizer and corrosive. Its contact with other materials may cause a fire. Therefore, this experiment must be performed in a fume hood by using glassware, laboratory coat, and glove. After you complete the experiment, waste solutions and/chemicals should be placed in the waste container.

## Chemicals

| Substance | Name | State | GHS Hazard Statement |
| :---: | :---: | :---: | :---: |
| $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ | Potassium dichromate | Solid | $\begin{aligned} & \text { H340, H350, H360FD, H272, H301, } \\ & \text { H312, H314, H317, H330, H334, } \\ & \text { H335, H372, H410, P201, P221, } \\ & \text { P273, P280, P301 + P330 + P331, } \\ & \text { P302 + P352, P304 + P340, P305 + } \\ & \text { P351 + P338, P308 + P310 } \end{aligned}$ |
| $\mathrm{H}_{2} \mathrm{SO}_{4}$ | Sulfuric acid | Liquid | $\begin{aligned} & \mathrm{H} 290, \mathrm{H} 314, \text { P } 280, \text { P301 + P330 + } \\ & \text { P331, P303 + P361 + P353, P305 + } \\ & \text { P351 + P338 + P310 } \end{aligned}$ |
| $\mathrm{H}_{3} \mathrm{PO}_{4}$ | Phosphoric acid | Liquid | $\begin{aligned} & \mathrm{H} 290, \text { H302, H314, P260, P280, } \\ & \text { P301 + P312 + P330, P301 + P330 + } \\ & \text { P331, P303 + P361 + P353, P305 + } \\ & \text { P351 + P338 + P310 } \end{aligned}$ |
| $\mathrm{FeSO}_{4}$ | Iron(II) sulfate | Solid | $\begin{aligned} & \text { H302, H315, H319; P302 + P352, } \\ & \text { P305 + P351 + P338, P301 + P312 + } \\ & \text { P330 } \end{aligned}$ |
|  | Diphenylamine sodium sulfonate | Solid | H315, H319, H335 |

## Glassware and equipment

- 2 Volumetric flasks (with stoppers), 1000 mL
- 1 Volumetric flask (with stopper), 250 mL
- 2 Volumetric flasks (with stoppers), 100 mL
- 1 Volumetric flask (with stopper), 10 mL
- 1 Measuring cylinder, 100 mL
- 1 Measuring cylinder, 50 mL
- 1 Erlenmeyer flask, 250 mL
- 1 Burette, 50 mL
- 1 two-necked digestion flask
- 1 Weighing dish
- 1 Spatula
- 1 Transfer funnel
- 1 Laboratory stand with burette clamp
- 1 Weighing balance ( 0.1 mg )
- 1 Magnetic hotplate stirrer
- 1 Magnetic bar
- 1 Ice-bath or water-bath
- 1 Thermometer
- 1 Stopwatch
- Beakers (for transfers)
- Bossheads and clamps
- Water-ice bath
- Pasteur pipettes

## Reagent and Standard Solutions

Potassium dichromate solution: Potassium dichromate ( 8.825 g ), previously oven dried at about $140{ }^{\circ} \mathrm{C}$ for 1 hour, is transferred into a 100 mL flask, dissolved in about 90 mL of deionized water, and then diluted to the volume with deionized water $\left(0.3 \mathrm{M} \mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}\right)$.

Phosphoric acid-sulfuric acid solution: 1.5 mL of concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ is added slowly to 5 mL of deionized water under stirring in a 10 mL flask. 1.5 mL of $85 \%$ phosphoric acid is also added to this flask, cooled at room temperature, and diluted to exact volume with deionized water. Note: Be careful during this step because the process of adding acid to water is exothermic.

Iron(II) sulfate standard solution: Iron(II) sulfate ( 3.038 g ) is transferred into a 100 mL flask and dissolved in about 80 mL of deionized water. Then 2 mL of concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ is added to this $\mathrm{FeSO}_{4}$ solution slowly under stirring. The mixture is cooled to room temperature and diluted to exact volume ( $0.2 \mathrm{M} \mathrm{FeSO}_{4}$ ).

Diphenylamine sodium sulfonate indicator solution: 20 mg of 4-diphenylamine sodium sulfonate is dissolved in concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ in a 10 mL flask.

## Procedure

1. Weigh about 10 mg of Oltu stone sample using a weighing balance and write down the exact weight of the sample.
2. Place this Oltu stone sample into a digestion flask over a magnetic hotplate stirrer and then add 5 mL of $0.3 \mathrm{M} \mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ in a fume hood.
3. Add slowly 20 mL of concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ while cooling the flask in a water-ice bath. Put a magnetic bar and stir at 200 rpm .
4. Attach a thermometer to the stopper and heat rapidly until a temperature of $160^{\circ} \mathrm{C}$ is reached.
5. Maintain the temperature at $160 \pm 2{ }^{\circ} \mathrm{C}$ for 10 min .
6. Transfer the solution to a 250 mL Erlenmeyer flask and cool to room temperature with tap water.
7. Add 8 drops of the phosphoric acid/sulfuric acid mixture and 4 drops of 4-diphenylamine sodium sulfonate indicator to the solution.
8. Fill the burette with standard $0.2 \mathrm{M} \mathrm{FeSO}_{4}$ solution until the volume line.
9. Titrate the excess $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ with a $0.2 \mathrm{M} \mathrm{FeSO}_{4}$ solution. The color change is from violet to dirty gray (end point) and finally green.
10. Repeat steps $1-9$ with another Oltu stone sample as necessary.
11. Perform the same experiment using a blank (in the absence of Oltu stone sample) solution.

Figure P2-1. A titration setup

## Calculations \& Analysis

P2.1. Write all balanced equations during this experiment.

P2.2. Calculate the mean total carbon content of the Oltu stone sample as weight $\%$.

## Problem P3. Spectrophotometric Determination of the Equilibrium Constant for the Formation of a Complex

In this task, the complexation reaction between $\mathrm{I}_{2}$ and pyridine (pyr) will be followed by spectrophotometry to determine the equilibrium constant ( $K$ ) of this complexation reaction. $\mathrm{I}_{2}$ and $\mathrm{I}_{2}$ pyr complex can absorb visible region of electromagnetic radiation but pyr cannot because it is colorless. Analysis of the spectral changes with variation in pyr concentration and with constant total iodine concentration provides the determination of $K$ of the complexation reaction.

Caution: All operations should be carried out in a fume hood except for spectrophotometric measurements. After you complete the experiment, waste solutions and/or chemicals should be placed in the waste container.

## Chemicals

| Substance | Name | State | GHS Hazard Statement |
| :--- | :--- | :--- | :--- |
| $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}$ | Pyridine | Liquid | $\mathrm{H} 225, \mathrm{H} 302+\mathrm{H} 312+\mathrm{H} 332, \mathrm{H} 315, \mathrm{H} 319 ;$ P210, <br> $\mathrm{P} 280, \mathrm{P} 301+\mathrm{P} 312+\mathrm{P} 330, \mathrm{P} 302+\mathrm{P} 352+\mathrm{P} 312$, <br> $\mathrm{P} 304+\mathrm{P} 340+\mathrm{P} 312, \mathrm{P} 305+\mathrm{P} 351+\mathrm{P} 338$ |
| $\mathrm{C}_{6} \mathrm{H}_{12}$ | Cyclohexane | Liquid | $\mathrm{H} 225, \mathrm{H} 304, \mathrm{H} 315, \mathrm{H} 336, \mathrm{H} 410, \mathrm{P} 210, \mathrm{P} 273, \mathrm{P} 301$ <br> $+\mathrm{P} 310+\mathrm{P} 331, \mathrm{P} 302+\mathrm{P} 352$ |
| $\mathrm{I}_{2}$ | Iodine | Solid | $\mathrm{H} 312+\mathrm{H} 332, \mathrm{H} 315, \mathrm{H} 319, \mathrm{H} 335, \mathrm{H} 372, \mathrm{H} 400$, <br> $\mathrm{P} 273, \mathrm{P} 280, \mathrm{P} 302+\mathrm{P} 352+\mathrm{P} 312, \mathrm{P} 304+\mathrm{P} 340+$ <br> $\mathrm{P} 312, \mathrm{P} 305+\mathrm{P} 351+\mathrm{P} 338, \mathrm{P} 314$ |

## Glassware and equipment

- Spectrophotometer
- 2 UV-vis glass, quartz or plastic absorption cuvettes
- 1 Volumetric flask (with stopper), 50 mL
- 6 Volumetric flasks (with stoppers), 25 mL
- 1 Pipette, 1 mL
- 1 Pipette, 10 mL
- 1 Pipetting bulb

## Reagent and Standard Solutions

1. 0.050 M pyr in cyclohexane ( 50 mL for each student, concentrations must be known accurately).
2. $0.010 \mathrm{M}_{2}$ in cyclohexane ( 25 mL for each student, concentrations must be known accurately).

## Procedure

1. Pipette the following volumes of stock solutions into six $25-\mathrm{mL}$ volumetric flasks labeled as F-0, F-1, F-2, F-3, F-4, and F-5; dilute to the mark with cyclohexane; and mix them well.

| Flask | Volume of pyr stock <br> solution $/ \mathrm{mL}$ | Volume of $I_{2}$ stock <br> solution $/ \mathrm{mL}$ |
| :---: | :---: | :---: |
| F-0 | 0.0 | 1.0 |
| F-1 | 1.0 | 1.0 |
| F-2 | 2.0 | 1.0 |
| F-3 | 3.0 | 1.0 |
| F-4 | 4.0 | 1.0 |
| F-5 | 5.0 | 1.0 |

2. Use two glass absorption cells with solvent in both the sample and the reference cells and scan the wavelength between 350 and 800 nm to record a baseline.
3. Record all spectra for the samples using this background.
4. Measure the absorbance values at the wavelengths of the two maxima in each spectrum by subtracting the absorbance of the blank from each.

Depending on the complexation reaction,

$$
K=\frac{\left[I_{2} \cdot p y r\right]}{\left[I_{2}\right][p y r]}
$$

Consider a series of solutions in which increments of pyr are added to a constant amount of $\mathrm{I}_{2}$. Letting $\mathrm{I}_{2(0)}$ be the total concentration of $\mathrm{I}_{2}$ (in the forms $\mathrm{I}_{2}$ and $\mathrm{I}_{2}$ pyr), we can write

$$
\left[I_{2}\right]=\left[I_{2(0)}\right]-\left[I_{2} \cdot p y r\right]
$$

K expression can be rearranged as follows:

$$
\begin{gathered}
\frac{\left[I_{2} \cdot p y r\right]}{[p y r]}=K\left[I_{2}\right] \\
\frac{\left[I_{2} \cdot p y r\right]}{[p y r]}=K\left(\left[I_{2(0)}\right]-\left[I_{2} \cdot p y r\right]\right)
\end{gathered}
$$

Based on the last equation, a graph of $\frac{\left[I_{2} \cdot p y r\right]}{[p y r]}$ vs. $\left[I_{2} \cdot p y r\right]$ has a slope of $-K$.
If we know $\left[I_{2} \cdot p y r\right]$, we can find $[p y r]$ with the mass balance

$$
p y r_{0}=[\text { total pyr }]=\left[I_{2} \cdot p y r\right]+[p y r]
$$

To measure $\left[I_{2}\right.$. pyr], we use absorbance values. Suppose that $I_{2}$ and $I_{2}$.pyr each has some absorbance at wavelength $\lambda$, but $p y r$ has no absorbance at this wavelength. Let us assume that we measure absorbance values at a path length of 1 cm so that we can omit it when writing Beer's law. The absorbance at every wavelengths is the sum of absorbances of $I_{2}$ and $I_{2} \cdot p y r$

$$
A=\varepsilon_{I_{2} \cdot p y r}\left[I_{2} \cdot p y r\right]+\varepsilon_{I_{2}}\left[I_{2}\right]
$$

Substituting $\left[I_{2}\right]=\left[I_{2(0)}\right]-\left[I_{2} \cdot p y r\right]$, we can write

$$
A=\varepsilon_{I_{2} \cdot p y r}\left[I_{2} \cdot p y r\right]+\varepsilon_{I_{2}}\left[I_{2(0)}\right]-\varepsilon_{I_{2}}\left[I_{2} \cdot p y r\right]
$$

In the last equation $\varepsilon_{I_{2}}\left[I_{2(0)}\right]$ is $A_{0}$, the initial absorbance before any pyr is added. Therefore,

$$
A=\left[I_{2} \cdot p y r\right]\left(\varepsilon_{I_{2} \cdot p y r}-\varepsilon_{I_{2}}\right)+A_{0} \text { and }\left[I_{2} \cdot p y r\right]=\frac{\Delta A}{\Delta \varepsilon}
$$

where $\Delta \varepsilon=\varepsilon_{I_{2} \cdot p y r}-\varepsilon_{I_{2}}$ and $\Delta A=A-A_{0}$ is the observed absorbance after each addition of pyr minus the initial absorbance.

Substituting $\quad\left[I_{2} . p y r\right]$ from $A=\frac{\Delta A}{\Delta \varepsilon}\left(\varepsilon_{I_{2}, p y r}-\varepsilon_{I_{2}}\right)+A_{0} \quad$ and $\quad$ writing $\quad$ it $\quad$ in $\frac{\left[I_{2} \cdot p y r\right]}{[p y r]}=K\left(\left[I_{2(0)}\right]-\left[I_{2} \cdot p y r\right]\right)$ gives the following equation:

$$
\frac{\Delta A}{[p y r]}=K \Delta \varepsilon\left[I_{2(0)}\right]-K \Delta A
$$

This equation is known as the Scatchard equation.

## Calculations \& Analysis

P3.1. Draw a graph of $\frac{\Delta A}{[\text { free pyr }]}$ vs. $\Delta A$ (Scatchard plot).
P3.2. Determine the $K$ value of this complexation reaction from the slope.

P3.3. Determine the $\Delta \varepsilon$ value using the intercept.

P3.4. Determine the $\varepsilon_{I_{2}}$ value using the absorption band of $I_{2}$.

P3.5. Calculate the $\varepsilon_{I_{2} . p y r}$ value.

P3.6. Observe if there is an isosbestic point in this experiment.

P3.7. If yes, explain why an isosbestic point is observed.

## Problem P4. 1-Bromobutane

Nucleophilic substitution reactions are the most fundamental reactions among the organic functional group transformations. In these reactions, an electronegative atom or electronwithdrawing group is replaced by another atom or group. Replacement of the hydroxyl group is subject to special interest since it has a vital role in carbohydrate chemistry. For instance, sucrose is commonly used in our everyday life since many carbohydrates taste sweet. When we consume sucrose, excess calories are stored as fat in our bodies. To avoid the storage of fat because of excessive sucrose consumption, sucrose can be converted to synthetic sweetener, sucralose, through substitution reactions. On the other hand, sucralose is known diet friendly and it is much sweeter than sucrose.

Considering the impact of substitution reactions in our everyday life, in this task, you are asked to synthesize 1-bromobutane starting from 1-butanol by an $S_{\mathrm{N}} 2$ reaction. Among several routes, an aqueous solution of sodium bromide and excess sulfuric acid method is preferred.

## Chemicals

| Substance | Name | State | GHS Hazard Statement |

## Glassware and equipment

- 1 Graduated cylinder, 10 mL
- 1 Graduated cylinder, 50 mL
- 1 Weighing dish
- 1 Weighing balance ( 0.01 g )
- 1 Spatula
- 2 Laboratory stands
- 1 Thermometer
- 1 Magnetic stirrer
- Bossheads and clamps
- 1 Condenser
- 1 Reflux condenser
- 1 Round-bottom flask, 100 mL
- 1 Dropping funnel
- 1 Distillation head
- 1 Distillation adapter
- 1 Erlenmeyer flask, 50 mL
- 1 Separatory funnel, 100 mL
- Ice-water bath

## Procedure

1. Add 13.3 g of sodium bromide, 15 mL of water, and 10 mL of 1-butanol to a 100 mL roundbottom flask.
2. Cool the mixture in an ice-water bath.
3. Slowly add 11.5 mL of concentrated sulfuric acid while stirring and cooling the reaction mixture. (Warning: Be careful in handling concentrated sulfuric acid.)
4. Place the flask on a hot plate, clamp it securely, and fit it with a short reflux condenser. Heat the resulting mixture to boiling point. Adjust the heat for brisk and steady refluxing.

Figure P4-1. Refluxing apparatus
5. Reflux for 45 minutes, remove the heater, and let the condenser drain for a few minutes.
6. Remove the condenser, mount the distillation head to the flask, and set up the condenser for simple distillation through the distillation adapter into the 50 mL Erlenmeyer flask. Clamp joints of the glassware securely.

Figure P4-2. Distillation apparatus
7. Distill the mixture until clear water droplets appear.
8. Pour the distillate into a separatory funnel, shake with about 10 mL of water, and note that $n$-butyl bromide (1-bromobutane) now forms the lower layer. Pink coloration in this layer can be discharged by adding a little bit of sodium bisulfite and shaking the separatory funnel again (See P5.5 for detailed explanation about using separatory funnel and extraction process).
9. Drain the lower layer of 1-bromobutane into a clean flask, clean and dry the separatory funnel, and return the 1-bromobutane to the cleaned separatory funnel.
10. Then add 10 mL of precooled concentrated sulfuric acid to the separatory funnel, shake the funnel, and wait 5 minutes for separation of the layers. (Warning: Be careful in handling concentrated sulfuric acid.)
11. Separate the layers. Then wash 1-bromobutane with 10 mL of 3 M sodium hydroxide solution to remove traces of acid.
12. Dry the cloudy 1-bromobutane by adding anhydrous calcium chloride pellets (about 1 g ) while stirring until the liquid becomes clear.
13. After 5 minutes, decant or filter the dried liquid into a 25 mL flask.
14. Distill and collect the product boiling in the range of $99-103^{\circ} \mathrm{C}$ using a simple distillation apparatus.

## Question

P4.1. In step 8, the organic layer is treated with a little bit of sodium bisulfite. Explain the reason.

P4.2. Explain the roles of NaBr and $\mathrm{H}_{2} \mathrm{SO}_{4}$ in the reaction.

P4.3. Is this reaction possible in the absence of a strong acid?

P4.4. Compare the ${ }^{1} \mathrm{H}$ NMR spectra of 1-butanol and 1-bromobutane in $\mathrm{CDCl}_{3}$ in terms of number of peaks and multiplicities.

P4.5. Would you expect other by-products to be formed in this reaction? What is it?

## Problem P5. Cannizzaro Reaction

Aldehydes are widespread in nature. Most of them are known for their sweet odors. For instance, vanillin exists in vanilla with its distinct odor. Aldehyde functional group-containing molecules are often used in perfumes because of their pleasant fragrance. Benzaldehyde provides the distinctive smell of almonds. Stanislao Cannizzaro discovered in 1853 that benzaldehyde on treatment with a base gave equimolar quantities of benzoic acid and benzyl alcohol. In this task, you are asked to prepare $p$-chlorobenzoic acid and p-chlorobenzyl alcohol through a Cannizzaro reaction of $p$-chlorobenzaldehyde.

Cannizzaro is a disproportionation reaction in which an internal oxidation/reduction reaction occurs. The reaction of an aldehyde with a strong base takes place only if the aldehyde has no alpha hydrogen atoms. The mechanism of the Cannizzaro reaction involves hydride ion $\left(\mathrm{H}^{-}\right)$ transfer, which takes place only in the presence of a strong nucleophile.

## Glassware and equipment

- 1 Two-neck round bottom flask, 50 mL
- 1 Magnetic stirrer
- 1 Graduated cylinder, 50 mL
- 1 Condenser
- 1 Separatory funnel, 100 mL
- 1 Büchner funnel, 250 mL
- 1 Büchner flask
- 1 Filter paper
- 2 Erlenmeyer flasks
- 1 Funnel
- 1 TLC development tank
- TLC sheets
- 1 UV lamp
- 1 Hot plate

## Procedure

1. Dissolve 2 g of $p$-chlorobenzaldehyde in 6 mL of ethanol in a 50 mL two-neck round bottom flask while stirring with a magnetic rod.
2. Add 6 mL of water to the above solution followed by the addition of 3.2 g of KOH in portions.
3. Mount a condenser above the reaction flask and heat the reaction mixture to $60-70{ }^{\circ} \mathrm{C}$.

Figure P5-1. The reaction apparatus with two-neck round bottom flask.
4. After 45 minutes, remove the flask from the water bath, allow the reaction mixture cool down to room temperature, transfer into a separatory funnel, and add 30 mL of water.
5. Perform extraction with 7 mL of methylene chloride three times. To do the extraction:

Figure P5-2. Extraction apparatus.

- Before adding methylene chloride to the separatory funnel, check the stopcock.
- To have sufficient room for extraction, fill the separatory funnel no more than threefourths full.
- When the stoppered funnel is shaken to distribute the components between methylene chloride and water, pressure always develops through volatilization of methylene chloride from the heat of the hands can increase the pressure.
- The funnel is grasped so that the stopper is held in place by one hand and the stopcock by the other. After a brief shake or two, the funnel is held in the inverted position, and the stopcock is opened cautiously to release pressure. This process is repeated with pressure released as necessary.
- When equilibration is judged to be complete, the layers are allowed to separate.
- p-chlorobenzyl alcohol is distributed wholly or largely into the bottom methylene chloride layer, whereas p-chlorobenzoic acid sodium salt, inorganic salts, acids or bases pass into the upper water layer.
- Separate the methylene chloride and aqueous layers by drowning off the bottom methylene chloride layer.
- This process is repeated three times and organic layers are collected in to an Erlenmeyer.
- Aqueous layer is drawn of in to another Erlenmeyer.

6. Acidify the aqueous basic solution with concentrated HCl until the solution is acidic (Acidity of solution can be inspected by Litmus paper). This will cause p-chlorobenzoic acid to precipitate as a white solid.
7. After cooling down the solution, $\underline{\text { filter }}$ the white solid under vacuum using a Büchner funnel.

Figure P5-3. Vacuum filtration with Büchner funnel and flask.
8. Recrystallize the obtained $p$-chlorobenzoic acid from ethanol. After air drying, weigh the product, and calculate the percent yield.To recrystallize $p$-chlorobenzoic acid from ethanol: Place the $p$-chlorobenzoic acid in an Erlenmeyer flask (never use a beaker), add enough ethanol to cover the crystals, and then heat the flask on a steam. Add ethanol gradually, keeping it at the
boiling point, until all of the solute dissolves (Be sure no flames are nearby when working with ethanol). Once it has been ascertained that the hot solution is saturated with the $p$-chlorobenzoic acid just below the boiling point of ethanol, allow the solution to cool down to room temperature slowly. With slow cooling, recrystallization should begin immediately. If not, add a seed crystal or scratch the inside of the Erlenmeyer with a glass rod. Once recrystallization is complete, $p$ chlorobenzoic acid crystals must be filtered using Büchner funnel-Büchner flusk and washed with ice-cold ethanol.
9. Organic phases from step 5 are gathered together in a separatory funnel and shaken with 15 mL of $40 \%$ bisulfite solution. The mixture is then washed with saturated sodium bicarbonate until a neutral solution is obtained.10. Drying the organic phase with sodium sulfate followed by filtration from filter paper and removal of solvent via simple distillation will afford crude $p$ chlorobenzyl alcohol.
11. $p$-Chlorobenzyl alcohol is recrystallized from acetone/petroleum ether (1:9).
12. Perform TLC analysis for $p$-chlorobenzoic acid, p-chlorobenzyl alcohol and starting material p-chlorobenzaldehyde using $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}(9 / 1)$ as the eluent. Report the $\mathrm{R}_{\mathrm{f}}$ values. TCL analysis can be performed as follow:

- Transfer the TLC eluent $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}: 4 / 1\right.$, approximately 1 mL$)$ in to the TLC development tank using a Pasteur pipette.
- Insert the TLC plate using tweezers, cover the tank with its cap and let the eluent reach approximately 0.5 cm bellow the top edge of the plate.
- Using tweezers, take the TLC plate out, draw the eluent front line and let the plate airdry.
- Place the TLC plate under the UV lamp in a hood. With a pencil, circle all the visualized spots and calculate the $\mathrm{R}_{\mathrm{f}}$ values of p-chlorobenzaldehyde and products designated as spots $\mathrm{A}, \mathrm{B}$, and C on Figure P5-3.

Figure P5-4. Sample TLC plate and representative $\mathrm{R}_{\mathrm{f}}$ values.
13. Measure the melting points of the products and report their purity based on TLC results and melting points.

## Question

P5.1. If the aldehyde in this reaction has an $\alpha$-hydrogen what kind of a reaction do you expect?

P5.2. Write the products if butanal or pivalaldehyde is used as reactant in this reaction.

P5.3. Tick the bases that can be used instead of KOH in this reaction.$\mathrm{K}_{2} \mathrm{CO}_{3}$NaOH$\mathrm{NaHCO}_{3}$
$\mathrm{Et}_{3} \mathrm{~N}$

P5.4. Which reacts faster in the Cannizzaro reaction if the initial nucleophilic attack is the rate determining step?

P5.5. What is the intermediate state in this reaction?

P5.6. Tick the oxidation and reduction products of this reaction.

| Oxidation product |  |  | Reduction product |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\square$ | $\square$ | $\square$ | $\square$ |  |  |
| $\square$ |  |  |  |  |  |

## Problem P6. 2,3-Dihydro-5,6-diphenylpyrazine

An imine is a functional group or chemical compound containing a carbon-nitrogen double bond. Some imine compounds can sometimes be referred to as Schiff bases. Imines may find utility in a wide range of contexts, including the development antimicrobial, antiviral and anticancer agents. Imines are also common intermediates in enzymatic reactions and are used as common ligands in coordination chemistry. They are also used in nanotechnology for water treatment, encapsulation and functionalized magnetic nanoparticle production.

In this experiment you are asked to synthesize 2,3-dihydro-5,6-diphenylpyrazine (DPP) through an imine formation reaction, starting from benzil and ethylenediamine.

## Chemicals

| Substance | Name | State | GHS Hazard Statement |
| :---: | :---: | :---: | :---: |
| $\mathrm{C}_{14} \mathrm{H}_{10} \mathrm{O}_{2}$ | Benzil | Solid | $\begin{aligned} & \text { H315, H319, P302 + P352, P305 + P351 + } \\ & \text { P338 } \end{aligned}$ |
| $\mathrm{H}_{2} \mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{NH}_{2}$ | Ethylenediamine | Liquid | $\begin{aligned} & \mathrm{H} 226, \text { H302 + H332, H311, H314, H317, } \\ & \mathrm{H} 334, \text { H412, P210, P273, P280, P301 + } \\ & \text { P330 + P331, P302 + P352, P304 + P340, } \\ & \text { P305 + P351 + P338, P308 + P310 } \end{aligned}$ |
| $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ | Ethanol | Liquid | H225, H319, P210, P305 + P351 + P338 |

## Glassware and equipment

- 1 Round-bottom flask, 250 mL
- 1 Stirring bar
- 1 Pipette, 10 mL
- 1 Reflux condenser
- 1 Beaker, 100 mL
- 1 Crystallization dish, 500 mL
- 1 Büchner funnel
- 1 Büchner flask
- 1 Filter paper
- 1 TLC development tank
- 1 TLC sheets
- 1 UV lamp
- 1 Magnetic stirrer with a hot plate
- 1 Ice-water bath

## Procedure

1. Dissolve 10 g of benzil in 30 mL of ethanol (95\%) by heating in a 250 mL round bottom flask. Add 4.5 mL of $68 \%$ ethylenediamine (or an equivalent quantity of ethylenediamine in different concentrations).
2. While stirring, heat the mixture in a water bath under a reflux condenser for 45 minutes (See Figure P4.1 for reflux condenser apparatus).
3. If crystals have not formed in the flask, immediately transfer the hot supersaturated solution into a $100-$ or $150-\mathrm{mL}$ beaker. The difficulty of removing the crystals from the flask is thus avoided.
4. Often crystallization occurs at once when the solution is poured into the beaker, and sufficient heat is evolved to cause the alcohol to boil. Cool to room temperature. Finally, place in an icebath (For detailed recrystallization see P5.8).
5. The loss due to solubility in cold alcohol is negligible. Filter the crystals, and wash them with a little alcohol. Dry the product using a suction filter (For vacuum filtration apparatus see P5.7).
6. Weigh the dried product and calculate the percent yield.
7. Determine melting point (highly purified DPP melts at $161.5-162.5^{\circ} \mathrm{C}$ ), and reserve a little amount of product for TLC analysis.
8. Perform TLC analysis using the recrystallized product and reference benzil (See P5.12 for a sample procedure of TLC analysis).
9. Report the Rf values of each compound and check the purity of the recrystallized DPP.

## Question

P6.1. What is the product when DPP is oxidized?

P6.2. Is the oxidation product of the DPP aromatic?

P6.3. Which of the following reactants or methods could be used for the oxidation of DPP?
$\square$ 2,3-Dichloro-5,6-dicyanobenzoquinone (DDQ)Heating in air$\mathrm{Et}_{3} \mathrm{~N}$$\mathrm{Na}_{2} \mathrm{CO}_{3}$Slight heating under vacuum

P6.4. What are the hybridizations of nitrogen (b) and carbons (a and $\mathbf{c}$ ) in DPP?

DPP

P6.5. Draw the structures of the products when 1,3-propanediamine and 1,4-butanediamine were used instead of ethylenediamine.

## Problem P7. Determination of Rate Constants for $\boldsymbol{n}$-Butyl Acetate Hydrolysis

Hydrolysis, in other words splitting with water, is one of the most important reaction types that an ester can undergo. The hydrolysis of ester can be catalyzed either by acids or by bases and when the catalyst is a base, the reaction yields a carboxylate salt and an alcohol.

In this experiment, you are asked to determine rate constants of the alkaline hydrolysis of $n$ butyl acetate using sodium hydroxide, which is a typical second-order reaction.

The rate of the reaction can be calculated by the following equation:

$$
\text { Reaction rate }=\mathrm{k}\left[\mathrm{CH}_{3} \mathrm{COOC}_{4} \mathrm{H}_{9}\right]\left[\mathrm{OH}^{-}\right]
$$

Then

$$
\frac{1}{[\mathrm{~A}]}-\frac{1}{[\mathrm{~A}]_{0}}=\mathrm{k} \times t
$$

where $[\mathrm{A}]$ is the concentration of reactant at time $t([\mathrm{~A}]=[\mathrm{B}]),[\mathrm{A}]_{0}$ is the initial concentration and $k$ is the second-order constant, which has dimension of concentration ${ }^{-1} \operatorname{time}^{-1}\left(\mathbf{L} \mathbf{~ m o l}^{-1} \mathbf{s}^{-}\right.$ ${ }^{1}$ ). In this case, a characteristic plot that will produce a linear function is $1 /[\mathrm{A}]$ vs. time $t$, with a slope of $k$.

Chemicals
\(\left.\begin{array}{|l|l|l|l|}\hline Substance \& Name \& State \& GHS Hazard Statement <br>

\hline \mathrm{NaOH} \& n-Butyl acetate \& Aqueous solution \& H226, H336, P210\end{array}\right]\)| Sodium hydroxide |
| :--- |
| HCl |

## Glassware and equipment

- 1 Laboratory stand with burette clamp
- 5 Volumetric pipettes, 20 mL
- 5 Pipette pump
- 5 Titration flasks, 250 mL
- 10 Volumetric flasks, 250 mL
- 1 Burette, 50 mL
- Stop watch

## Procedure

1. Fill the burette with the solution of hydrochloric acid ( HCl ) ( 0.02 M ).
2. Transfer 60 mL of the solution of $n$-butyl acetate $(0.02 \mathrm{M})$ into the volumetric flask and 60 mL of the solution of sodium hydroxide $(0.02 \mathrm{M})$ into another volumetric flask at room temperature. Mix the two solutions in titration flask.
3. Five minutes after mixing, pipette 20 mL of reaction mixture into a titration flask. Add 4 drops of phenolphthalein indicator to the solution.
4. Titrate the sample solution with $\mathrm{HCl}(0.02 \mathrm{M})$ until the solution become as colorless. Record the amount of HCl used. Hint: you can add 6 ml of HCl solution immediately and then carry out the rest of titration with more care.
5. Repeat steps 3 and 4 for $10,15,20$, and 25 minutes from the moment of mixing. Fill in the table below.

Hint: You can repeat each step several times to increase the accuracy of data.

## Calculations \& Analysis:

Fill in the blanks in the following table with the data measured during the experiment.

| Time (min) | $\mathbf{V H C l}^{(m L)}$ |
| :--- | :--- |
| 5 |  |
| 10 |  |
| 15 |  |
| 20 |  |
| 25 |  |

P7.1. Calculate the concentration of $\left[\mathrm{OH}^{-}\right]$at each time.
P7.2. Plot $\frac{1}{\left[\mathrm{OH}^{-}\right]}$vs. time .
P7.3. Calculate the rate constant.
P7.4. Calculate the reaction rate.
P7.5. Calculate the initial half-life for the reaction with initial conditions.

## Problem P8. Activation Energy of Bromide / Bromate Reaction

Activation energy is the minimum amount of energy which is required for a chemical reaction to occur. Activation energy can be defined also as the energy difference between the reactants and the activated complexes.

In this experiment, you are asked to calculate the activation energy of the following reaction:

$$
\mathrm{KBrO}_{3}+5 \mathrm{KBr}+3 \mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow 3 \mathrm{~K}_{2} \mathrm{SO}_{4}+3 \mathrm{Br}_{2}+3 \mathrm{H}_{2} \mathrm{O}
$$

In this reaction, the reaction order for $\mathrm{KBrO}_{3}$ and KBr is the same and is observed to be one. By using Arrhenius equation:

$$
k=A \cdot e^{-\frac{E_{a}}{R T}} \text { or } \ln k=\ln A-\frac{E_{a}}{R T}
$$

For a first rate reaction where $A \xrightarrow{k}$ products;

$$
\begin{gathered}
-\frac{d[A]}{d t}=k[A] \\
-\int_{A_{0}}^{A} \frac{d[A]}{[A]}=k \int_{0}^{t} d t \\
\ln \frac{[A]_{0}}{[A]}=k \times t=p
\end{gathered}
$$

$p=k \times t$ and it is a constant. Logarithm of this equation:

$$
\begin{aligned}
& \ln p=\ln k+\ln t \\
& \ln k=\ln p-\ln t
\end{aligned}
$$

If we use $\ln k=\ln p-\ln t$ for Arrhenius equation then;

$$
\begin{gathered}
\ln p-\ln t=\ln A-\frac{E_{a}}{R T} \\
-\ln t=(\ln A-\ln p)-\frac{E_{a}}{R T}
\end{gathered}
$$

Consider, $\ln A-\ln k=K$ then;

$$
\ln t=\frac{E_{a}}{R T}-K
$$

Completion of the reaction will be observed by following the decoloration of the solution. The reaction yields $\mathrm{Br}_{2}$, which gives a very rapid reaction with phenol yielding tribromophenol. When all the phenol is used, the remaining $\mathrm{Br}_{2}$ will decolorate the indicator.

## Chemicals

|  | Methyl red | Solution | R 51/53, S 61 |

## Glassware and equipment

- 3 Glass volumetric pipettes, 10 mL
- 10 Glass test tubes, 15 mL
- Wash bottle
- 2 Laboratory stands with appropriate clamps
- Thermostated water bath
- Stop watch

## Procedure

1. Prepare the following solutions in two separate test tubes:

Solution I: 5 mL of 0.01 M phenol, 5 mL of $\mathrm{KBr}-\mathrm{KBrO}_{3}$ solution (dissolve 50 mg of KBr and 14 mg of $\mathrm{KBrO}_{3}$ in 5 mL of deionized water), a few drops of methyl red indicator

Solution II: 2.5 mL of $0.5 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$
2. Place them into a thermostated circulating water bath.
3. When the temperature reaches $25^{\circ} \mathrm{C}$, mix the two solutions together, start your timer, and stop the timer when the red color completely disappears. Record the time.
4. Repeat steps $1-3$ for $35^{\circ} \mathrm{C}, 45^{\circ} \mathrm{C}, 55^{\circ} \mathrm{C}, 65^{\circ} \mathrm{C}$.

If you do not have a thermostat, instead of different temperatures, perform the experiment in an ice bath (or cold water) and at room temperature, then measure the temperature, redesign the tables in step 8.2 and 8.3 accordingly.

Calculations \& Analysis
P8.1. Calculate final concentrations of $\mathrm{H}_{2} \mathrm{SO}_{4}, \mathrm{KBr}$, and $\mathrm{KBrO}_{3}$.

P8.2. Fill in the following table.

| $\mathbf{T}\left({ }^{\circ} \mathbf{C}\right)$ | 25 | 35 | 45 | 55 | 65 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{t}$ (seconds) |  |  |  |  |  |

P8.3. Calculate $\ln t$ and $1 / T$ for each step and fill in the table below.

| $\ln \mathbf{t}$ |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{1 / T}\left(\mathbf{K}^{-1}\right)$ |  |  |  |  |  |

P8.4. Plot $\ln t$ vs. $1 / T$ and determine the slope of the plot.

P8.5. Calculate $\mathrm{E}_{\mathrm{a}}$.

The End
